AZDORA: Continuous Integration for the DISCOS project

Friday 9 October 2015 09:25 (25 minutes)

DISCOS is the "Development of the Italian Single-dish Control System" used in SRT, Medicina and Noto radiotelescopes. As the DISCOS project grows bigger every day, we need to assist the software development process with tools that automate the testing, building and releasing of the software package. We thus implemented AZDORA, a continuous integration system used to assess software quality and to automate environment installation for developers and in production systems.
