Galactic Plane Survey KSP: status & perspectives

Monday, 29 May 2023 14:30 (30 minutes)

Presenter: PINTORE, Fabio (Istituto Nazionale di Astrofisica (INAF))

Session Classification: Galactic Plane Survey

Contribution ID: 100

Type: **not specified**

Galactic PeVatron candidates in the LHAASO J1956+2845 sky region

Monday, 29 May 2023 15:00 (20 minutes)

In recent years the number of known sources emitting in the TeV-PeV regime has increased significantly thanks to facilities like LHAASO and HAWC. The more natural candidates, for energetic and ambient properties, are pulsars and their environment.

However, due to the limited angular resolution of the current instruments, many of the observed sources have more than one lower-energy counterpart. The identification and the classification of these sources is one of the primary goals of future facilities as CTAO, thanks to the designed sensitivity and angular resolution above 1 TeV.

In this talk I will present the sky region containing LHAASO J1956+2845, a case study to test the CTAO performances. This region extends for about 2 degrees and contains three HAWC sources, two of which are spatially coincident with LHAASO J1956+2845. Three middle-aged pulsars and three SNR/PWN systems are located in the field, but the associations are yet to be done, and it is not clear yet which of them is the principal contributor to the ~100 TeV emission.

Multi-wavelength context of the Cherenkov Telescope Array

TeV emitters are typically multi-wavelength sources, generally highly variable and occasionally highly polarized. This makes it critical to line up ground-based dedicated facilities for identification, follow-up and monitoring of CTA targets in polarized and total radio-to-optical light. Furthermore, the CTA itself provides suitable infrastructure for the implementation of specific observing techniques, such as the still pioneering Stellar Intensity Interferometry.

As part of the “CTA Plus” program funded by the Italian Research Ministry under the EU PNRR aegis, 4 initiatives will be implemented: a wide-field optical polarimetric imaging camera for the VST (VSTPol), a fast optical/IR photometer and optical polarimeter (eSiFAP) for the TNG, radio receiver upgrades for the INAF radio antennas, and a prototype for stellar intensity interferometry with the SSTs, to be tested on the ASTRI MiniArray. This talk will describe the instruments design and the observing strategies, and highlight the synergies with CTA.

High-Energy Variability in PWNe

Despite the long held assumption that PWNe at high energy could be counted as “stable candles”, detection of gamma-ray flares in the Crab nebula, led us to revisit our ideas about the working of such systems. Given the lack of resolution of current gamma-ray observations, analysis of variability was performed at other wavelengths in search for possible counterparts that could guide us to the origin of these violent events without much luck. I will review here the status of our knowledge of high-energy variability (and variability in general) in PWNe, as well as the various models that have been proposed, and what are the prospect of observing similar events in other systems.

Blazar monitoring by the Whole Earth Blazar Telescope (WEBT) Collaboration

Wednesday, 31 May 2023 10:40 (20 minutes)

Born in 1997 to provide an optical follow-up of gamma-loud blazars observed by the Compton Gamma Ray Observatory, the Whole Earth Blazar Telescope (WEBT) is a large collaboration including several tens of astronomers around the northern hemisphere who monitor blazars mainly in the optical (including polarimetry), but also in the radio and near-infrared bands. Since 2000 the Collaboration has been led by Italian researchers from the INAF- Osservatorio Astrofisico di Torino and has actively collaborated with other teams, in particular the AGILE, Fermi, and MAGIC ones. The strength of the WEBT is the high temporal resolution of the light curves, which can be obtained thanks to the distribution in longitude of its members. This allows us to study the details of the blazar multiwavelength behaviour, and to propose models for its interpretation. We are looking forward to a fruitful collaboration with the VHE community in the era of the new-generation Cherenkov telescopes.
