

Prospective Constraints on the Mass Distribution of the First Stars from the 21-cm Global Signal

Thomas Gessey-Jones

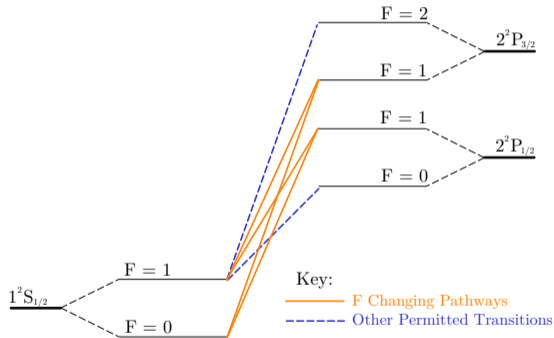

6th Global 21-cm Workshop

In collaboration with Nina Sartorio, Harry Bevens, Anastasia Fialkov,
Eloy de Lera Acedo, Will Handley, and Rennan Barkana

The Myriad Effects of the First Stars on the IGM

While Alive:

- WF Effect
- Lyman and CMB Heating
- Lyman-Werner Feedback
- Ionization

The Myriad Effects of the First Stars on the IGM

NASA/DOE/Fermi LAT Collaboration

In Death:

- Shock Heating
- Cosmic Ray Heating
- Metal Enrichment
- More Ionization

The Myriad Effects of the First Stars on the IGM

Afterlife:

- X-ray Heating
- X-ray Ionization

ESA, NASA, and Felix Mirabel

The Myriad Effects of the First Stars on the IGM

While Alive:

- **WF Effect**
- Lyman and CMB Heating
- **Lyman-Werner Feedback**
- Ionization

In Death:

- Shock Heating
- Cosmic Ray Heating
- Metal Enrichment
- More Ionization

Afterlife:

- **X-ray Heating**
- X-ray Ionization

Uncertainties in the Mass Distribution of the First Stars

Theoretical Uncertainty:

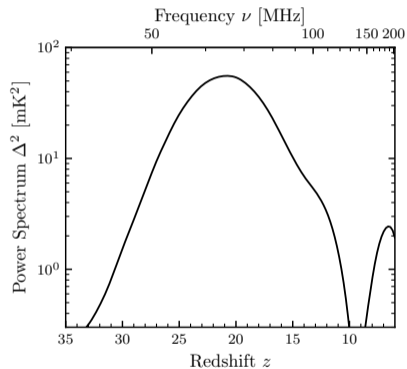

Klessen and Glover 2023

Observational Uncertainty:

Impacts of the First Stars IMF on the 21-cm Signal

Effects Included:

Impacts of the First Stars IMF on the 21-cm Signal

Effects Included:

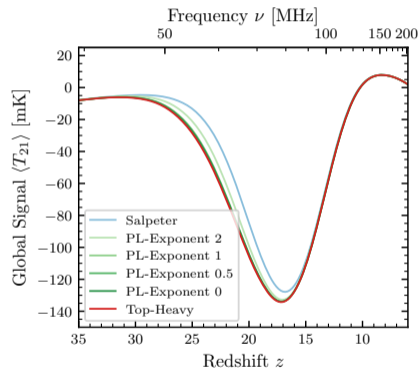

- Lyman Emission

Impacts of the First Stars IMF on the 21-cm Signal

Effects Included:

- Lyman Emission
- Finite Lifetimes

Impacts of the First Stars IMF on the 21-cm Signal

Effects Included:

- Lyman Emission
- Finite Lifetimes
- X-ray SED

Impacts of the First Stars IMF on the 21-cm Signal

Effects Included:

- Lyman Emission
- Finite Lifetimes
- X-ray SED
- X-ray Efficiency

Are these Impacts Measurable?

Challenges:

By what?

Foregrounds and Experimental
systematics

Degeneracies with other
astrophysics

Quantifying distinguishing power in
an interpretable way

Are these Impacts Measurable?

Summary of our Findings

- The **initial mass function of the first stars has a strong impact on the 21-cm signal** from cosmic dawn to the beginnings of the epoch of reionization
- A **Bayesian analysis** allows us to see what mass function is favoured by a data set while rigorously accounting for uncertain astrophysics
- Applying this to the forecast **REACH** fiduciary sensitivity of **25 mK**, we find a **3σ detection** of the correct mass function
- Pre-print paper coming soon, with forecasts for SKA1-LOW and joint analyses too
