17th European Solar Physics Meeting ESPM-17

Contribution ID: 177

Type: Poster

Understanding Precursors of Coronal Mass Ejections and Flares

Coronal mass ejections (CMEs) and solar flares are the most energetic explosive phenomena in our solar system and are able to release a large quantity of plasma and magnetic flux into the interplanetary space, probably affecting the safety of human high-tech activities in the outer space. To predict CME/flares caused space weather effects, we need to elucidate some fundamental but still puzzled questions, one of which concerns how are CME/flares initiated. In this talk, I will first present key observational characteristics before the main phase of CME/flares including the slow-rise precursor and pre-flare activities. I then show a MHD model aiming to understand these disclosed observational characteristics and propose a new CME/flare initiation paradigm.

Primary authors: XING, Chen (Nanjing University); AULANIER, Guillaume (Laboratoire de Physique des Plasmas); DING, Mingde (Nanjing University); CHENG, Xin (Nanjing University)

Session Classification: Coffee break and poster session 2

Track Classification: Multi-scale energy release, flares and coronal mass ejections
