# Intercomparison of the Metis/VL, LASCO-C2 and COR2-A coronagraphs

A. Burtovoi (University of Florence)

Y. De Leo, M. Romoli, L. Teriaca, F. Landini and R. Susino

The 9th Metis Workshop - 24-26 Jan 2023

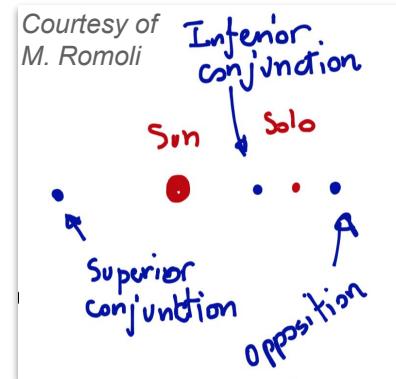

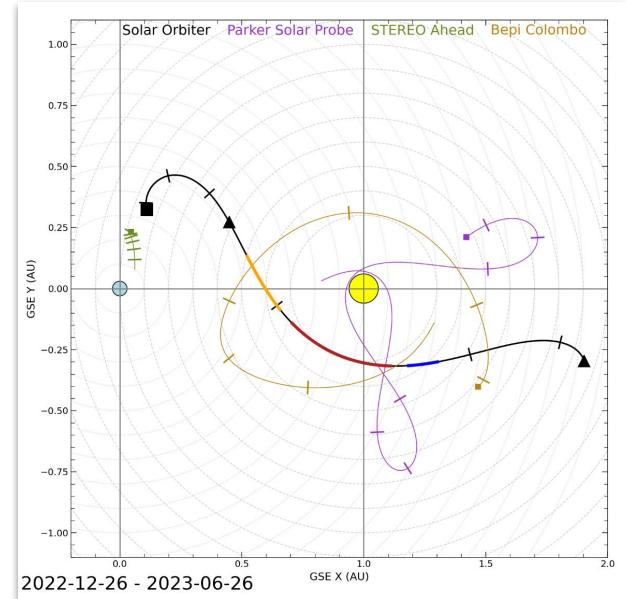

Agenzia  
Spaziale  
ItalianaINAF  
ISTITUTO NAZIONALE

NATIONAL INSTITUTE  
FOR ASTROPHYSICS

# Introduction

- Three currently operating visible light (VL) space coronagraphs: Metis/Solar Orbiter, LASCO/SOHO and COR2/STEREO-A
- Peculiar orbit of Solar Orbiter is an advantage ⇒ numerous conjunctions/oppositions

*Our goal:*

- ?
- To compare the coronal VL data of these instruments

FOR ASTROPHYSICS

# Dataset

- Instrument parameters:
  - Metis:
    - distance to Sun: variable (from 0.28 au)
    - field of view (FoV): variable (spanning from  $1.7 R_{\odot}$  to  $\sim 9 R_{\odot}$ )
  - LASCO-C2:
    - distance to Sun:  $\sim 1$  AU (L1 point)
    - FoV:  $2.5 - 6.2 R_{\odot}$
  - COR2-A:
    - distance to Sun:  $\sim 1$  AU
    - FoV:  $3 - 14 R_{\odot}$
- Orbital parameters:
  - $|\Delta l|$  and  $|\Delta b| < 5$  deg

# Image comparison procedure

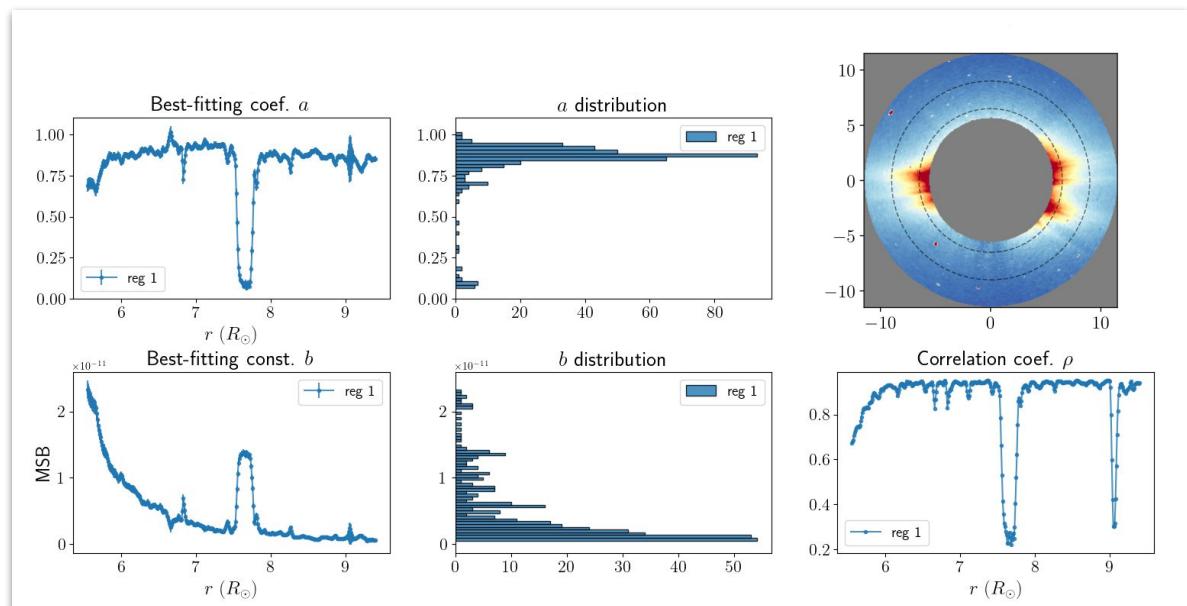

- We compare latitudinal profiles extracted for different heliocentric distances
- If they are correlated their regression follows the linear function  $f(x) = ax + b$
- We find the best-fitting  $a$  and  $b$ 
  - $a$  - scaling factor
  - $b$  - background

# Image comparison procedure

We repeat these calculations for all heliocentric distances ( $dr = 0.01 R_\odot$ ), ...

## Parameter space is big

- 828 pairs of images in total
- FoV sampling with  $dr = 0.01 R_{\odot}$
- 2 fitting parameters ( $a, b$ ) + correlation coefficient ( $\rho$ )
- 5 parameters of conjunction/opposition: type,  $\Delta d$ ,  $\Delta l$ ,  $\Delta b$ , FoV
- Polarized brightness + total brightness images
- Two currently available calibrations for LASCO-C2: from NRL/SolarSoft and from Legacy Archive (Lamy+2020, labeled as “C2\_L2020”)

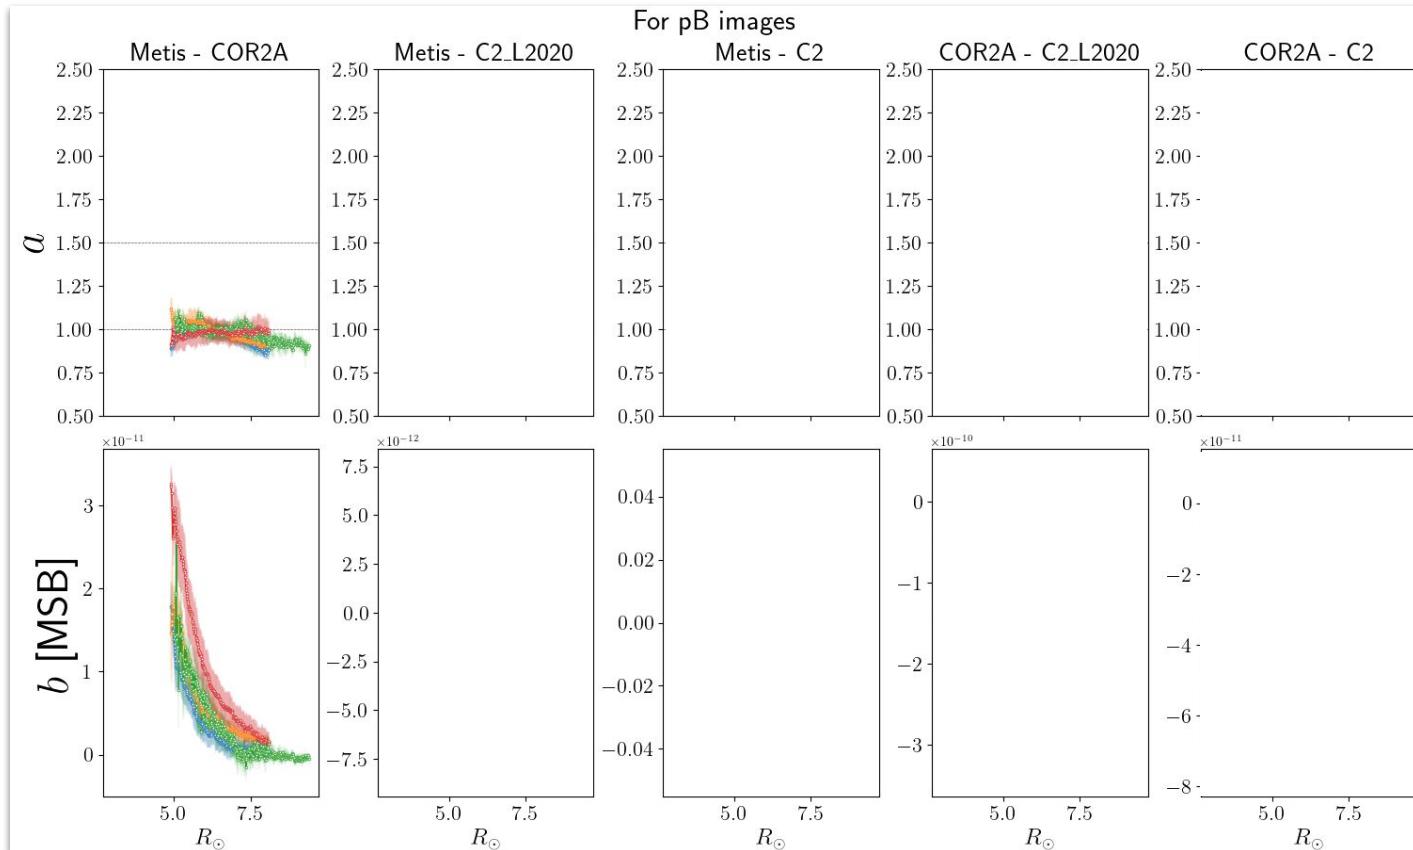

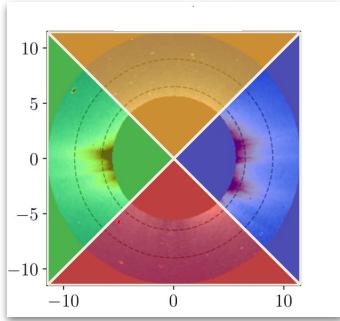

# PB-Results for $\langle a(r) \rangle_t$ and $\langle b(r) \rangle_t$ : COR2-A

**PRELIMINARY**

Data selection:

- $\rho \geq 0.95$
- $\Delta d \leq 0.2$  au

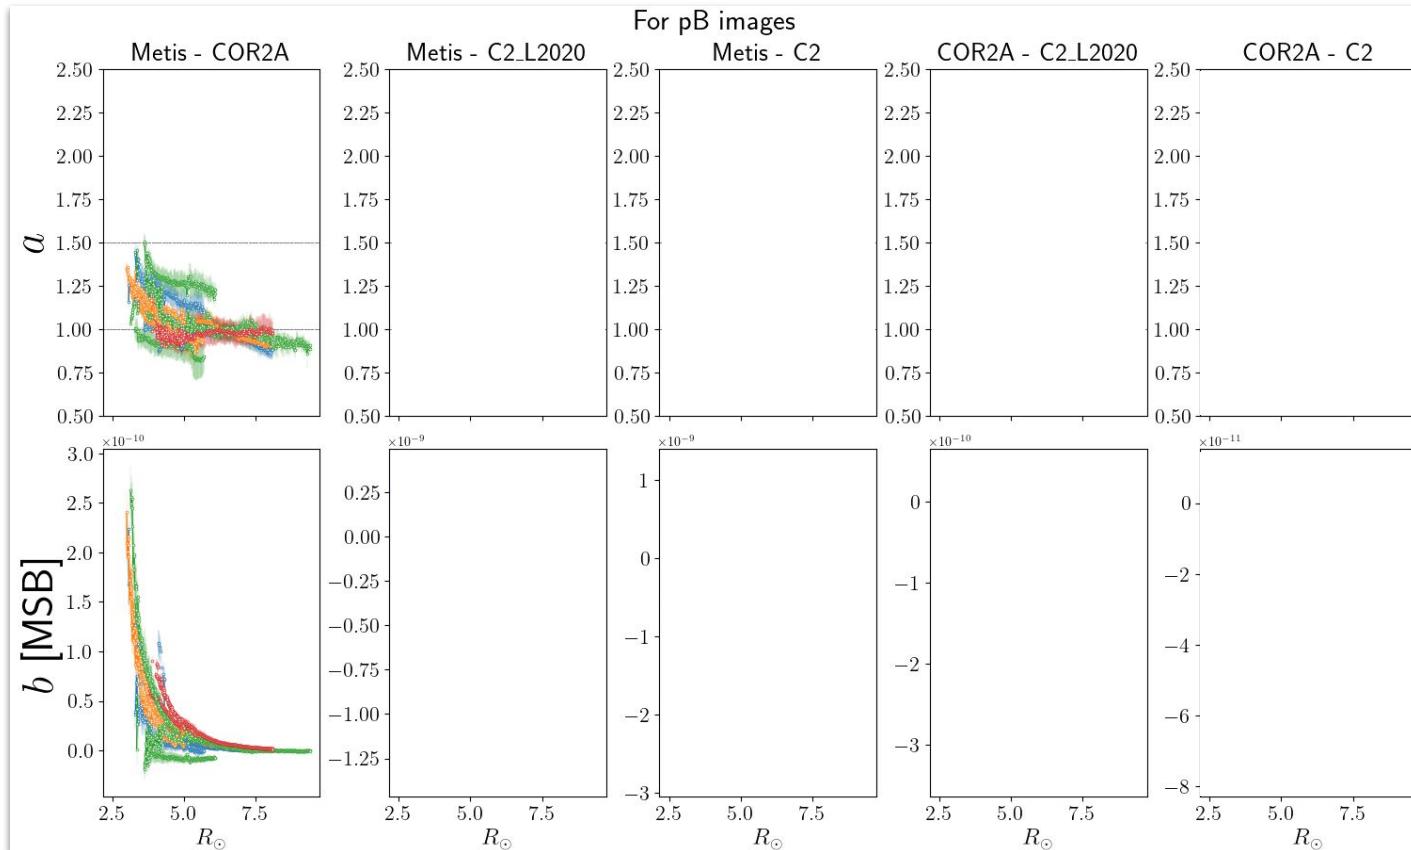

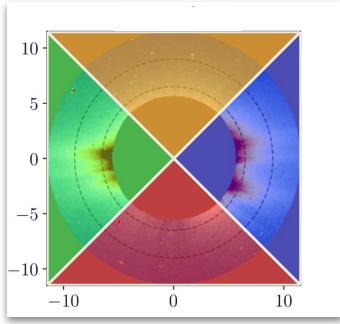

# PB-Results for $\langle a(r) \rangle_t$ and $\langle b(r) \rangle_t$ : COR2-A

PRELIMINARY

Data selection:

- $\rho \geq 0.95$
- all distances

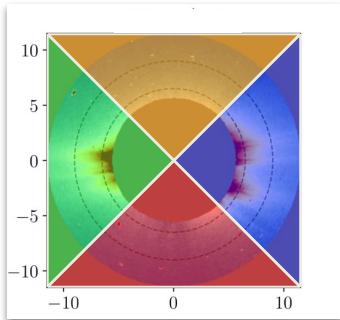

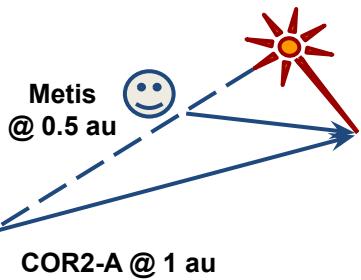

# PB-Results for $\langle a(r) \rangle_t$ and $\langle b(r) \rangle_t$ : COR2-A

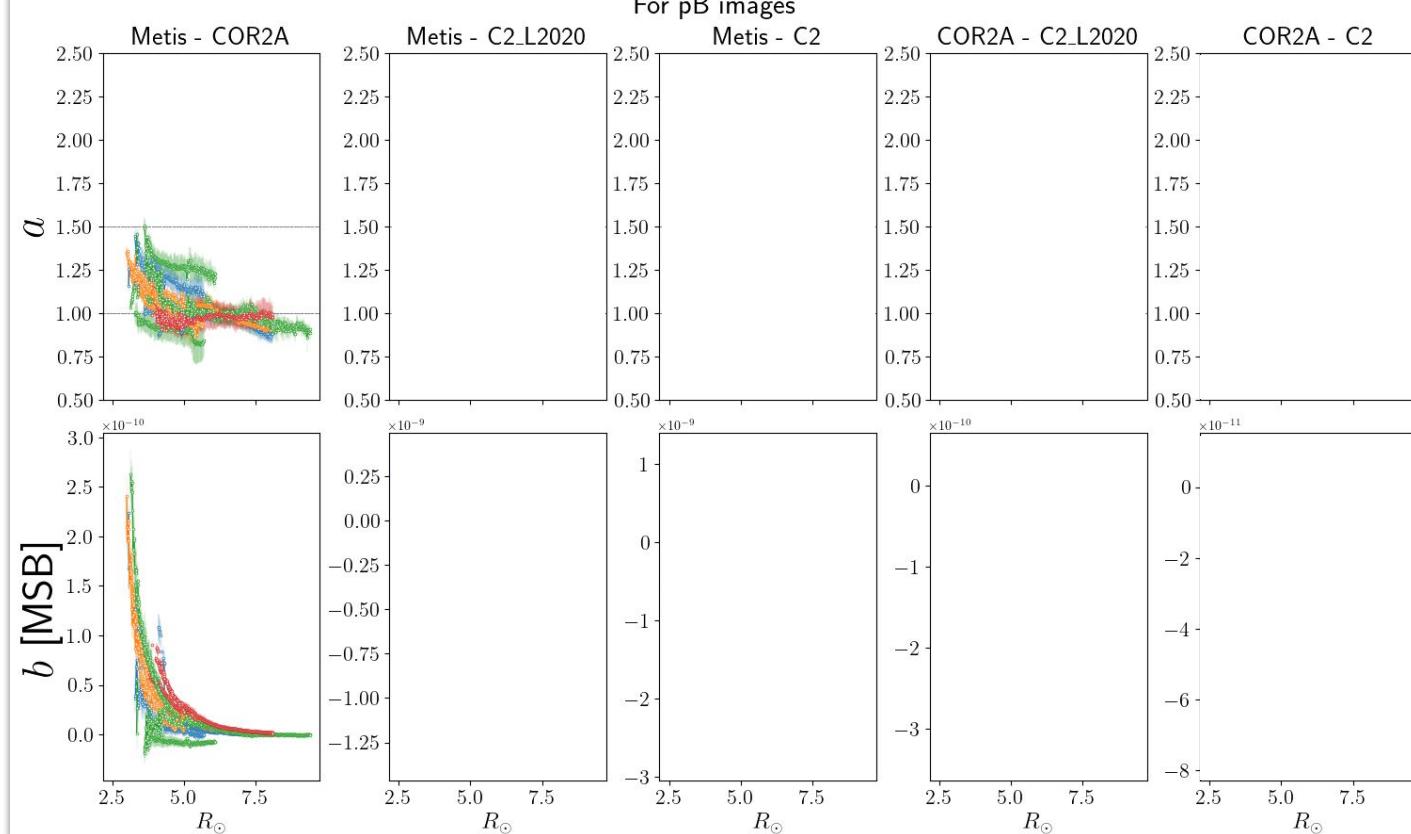

Data selection:

- $\rho \geq 0.95$
- all distances

**PRELIMINARY**

For pB images

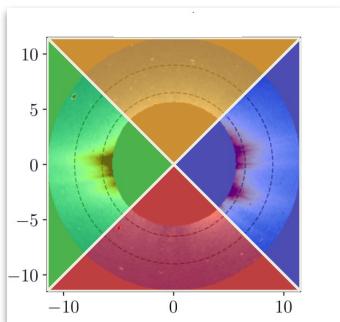

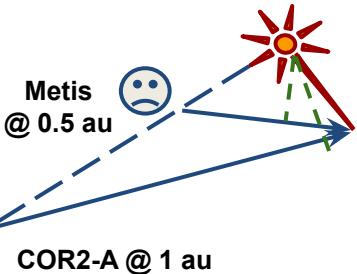

# PB-Results for $\langle a(r) \rangle_t$ and $\langle b(r) \rangle_t$ : COR2-A

**For Total Brightness:**

- Stray Light
- F-corona

# Conclusions and Future steps

## Conclusions and preliminary results

- $pB$ :
  - $pB(\text{Metis}) = (1.0 \pm 0.1) \cdot pB(\text{COR2-A}) + \text{Const}$
  - $pB(\text{Metis}) = (1.59 \pm 0.18) \cdot pB(\text{C2\_L2020}) + \text{Const}$ 
    - $pB(\text{Metis}) = (1.5 \pm 0.3) \cdot pB(\text{C2}) + \text{Const}$
  - $pB(\text{COR2-A}) = (1.4 \pm 0.1) \cdot pB(\text{C2\_L2020}) + \text{Const}$ 
    - $pB(\text{COR2-A}) = (1.13 \pm 0.12) \cdot pB(\text{C2\_L2020}) + \text{Const}$

## Future Steps

- Investigate the  $pB$  scaling factors  $a$  between Metis, LASCO-C2 and COR2-A
- Estimate the systematic effects due to different distance and viewing angle to the coronal structures seen with different instruments

Agenzia  
Spaziale  
Italiana

DI ASTROFISICA  
NATIONAL INSTITUTE  
FOR ASTROPHYSICS

# Conclusions and Future steps

## Future Steps for *B* images

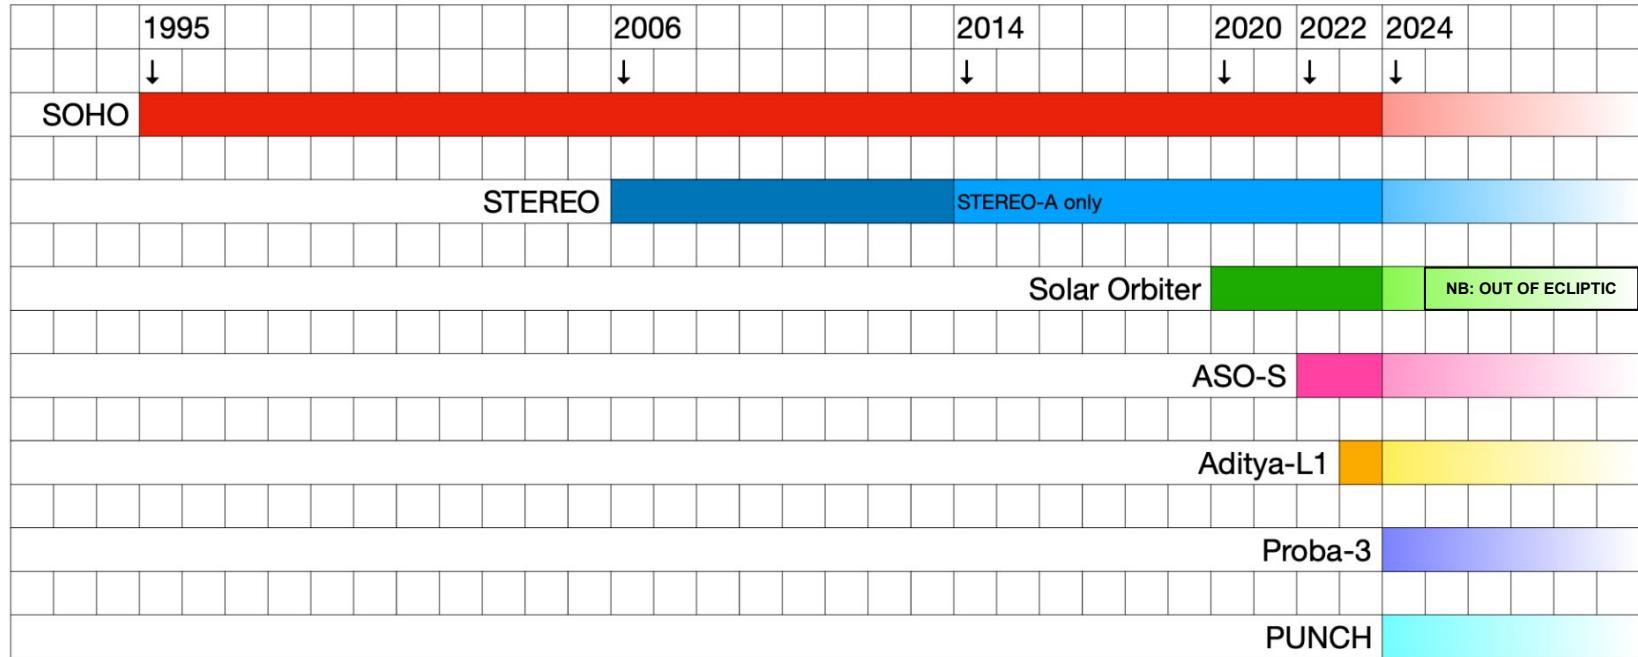

- Estimate the systematic effects due to
  - (as for  $pB$ ) different distance and viewing angle to the coronal structures seen with different instruments
  - different contribution of the F-corona
  - different contribution of the stray light
- Check the expected fluxes of the field stars seen with the instruments

Any contribution is welcome!
