IceCube: the First Decade of Neutrino Astronomy

francis halzen

- IceCube
- the cosmic neutrino energy spectrum
- first sources of neutrinos
- and the answer is: supermassive black holes at the cores of active galaxies?

highest energy "radiation" from the Universe: cosmic rays, mostly protons

the Extreme Universe is opaque to gamma rays beyond our Galaxy

photon energy in the Universe as a function of color

in the extreme universe neutrinos are unique astronomical messengers

the opaque extreme Universe:

- > PeV photons interact with extragalactic background light (CMB and higher energy photons) before reaching our telescopes
- their energy appears reprocessed in GeV photons, or beyond

black hole accelerating protons submersed in a target of radiation produce pions

$$\pi^{+} \to \mu^{+} + \widehat{\nu}_{\mu}$$

$$\longrightarrow e^{+} + \widehat{\nu}_{\mu} + \nu_{e}$$

$$\pi^{0} \to \widehat{\gamma} + \widehat{\gamma}$$

cosmic ray sources:
a gamma ray for
every neutrino

neutrino sources are cosmic ray sources

$$\gamma + \gamma \simeq \nu_{\mu} + \bar{\nu}_{\mu}$$
$$E_{\gamma} = 2E_{\nu}$$

- neutrino astronomy and the origin of cosmic rays
- IceCube
- the cosmic neutrino energy spectrum
- first sources of neutrinos
- and the answer is: supermassive black holes at the cores of active galaxies

IceCube:
5160 photomultipliers
instrument one km³ of
Antarctic ice between
1.4 and 2.4 km depth
as a Cherenkov detector

1 km³ instrumented with 5160 PMT (10inch) below 1450m

muon neutrino events [filtered by the Earth]: atmospheric vs cosmic

neutrinos interacting inside the detector

muon neutrinos filtered by the Earth

superior total energy measurement to 10%, all flavors, all sky

superior angular resolution 0.3° including systematics

- oscillations of PeV neutrinos over cosmic distances to 1:1:1
 - high energy (> teV) nutaus neutrino is of cosmic origin

Astrophysical Tau Neutrino Search

- TeV O(1) PeV Tau neutrinos look like Electron neutrinos due to sparse instrumentation
- Differentiation by shape of waveform in a given module, i.e. two waveforms in the same module offset by a certain quantity
- Create an image (2D histogram) of the of the charge distribution in time along a string
- CNN used to find the subtle difference in waveform shapes

→ Standard Model: 8 expected on a background of 1 and 7 found for a flavor ratio 1:1:1

Glashow resonance event with energy 6.3 PeV

$$E_R = M_W^2 / [2m_e]$$
$$= 6.32 \,\text{PeV}$$

resonant production of a weak intermediate boson by an anti-electron neutrino interacting with an atomic electron

- energy measurement understood
- shower consistent with the hadronic decay of a weak intermediate boson W
- identification of anti-electron neutrino
- SM cross section known → measure flux

in the extreme universe the energy in neutrinos is larger than the energy in gamma rays observed at GeV energies

energy in neutrinos (and accompanying gamma rays) dominates?

- gamma rays from π^0 accompanying IceCube neutrinos interact with interstellar photons and fragment into multiple lower energy gamma rays that reach earth
- they appear at MeV energies, or below [2205.03740 ph.HE]

cosmic ray sources

$$\gamma \simeq \nu_{\mu} + \bar{\nu}_{\mu}$$

gamma rays from neutral pions must lose energy in the sources if not, they would dominate the Fermi IGRB

the neutrino sources are likely opaque to gamma rays

or

rays
accompanying
neutrinos appear
at MeV energies
or below

energy in neutrinos in the Universe determined by the turnover at low energies:

starting event and starting track analyses track analyses

where is the neutrino Galactic plane?

by geometry the flux from your own Galaxy should dominate the diffuse flux from all other galaxies combined!

166 neutrino starting events

where is the neutrino Galactic plane?

by geometry the flux from your own Galaxy should dominate the diffuse flux from all other galaxies combined!

Fermi (GeV gamma rays) and IceCube (TeV neutrinos) see the same Galactic plane

neutrinos produced in Galactic cosmic rays interactions with interstellar medium

- Tibet AS γ -converted ν
- IceCube GP (π^0)
- Fermi-LAT GDE
- IceCube-converted γ

Galactic Diffuse Emission: Source Contribution

Hadronic diffuse emission or/and a population of γ -ray opaque neutrino emitters

KF & Murase ApJL (2023)

See also analysis of Vecchiotti+2023, Silvia+2024

- we do not have the sensitivity to see LHAASO sources
- rule out that the Crab is a hadronic source

- populate all galaxies in the Universe with neutrino sources
- seen from Earth you should see the sources in your own galaxy first; this is geometry
- the Milky Way should dominate the sky, as is the case for all wavelengths of light

- powerful accelerators operate in other galaxies that do not exist in our own
- our supermassive black hole has not been active for a few million years?

$$\frac{L_{\nu}^{EG}}{L_{\nu}^{MW}} \sim 120 \left[\frac{\Phi_{\nu}^{EG}/\Phi_{\nu}^{MW}}{5} \right] \left[\frac{n_0}{0.01 \, \mathrm{Mpc^{-3}}} \right]^{-1} \left[\frac{\xi}{3} \right]^{-1} \left[\frac{F_{\epsilon}}{1} \right]$$

measured IceCube fluxes

neutrino flux in active galaxies from diffuse flux observed neutrino flux in Milky Way from flux at Earth

factors of order unity ξ (cosmology) F_{ϵ} (geometry)

- in the extreme universe more energy is emitted in neutrinos than in gamma rays
- the π⁰ photons accompanying cosmic rays appear at MeV energy, or below
- powerful accelerators operate in other galaxies that do not exist in our own
- [our supermassive black hole has not been active for a few million years?]

- neutrino astronomy and the origin of cosmic rays
- IceCube
- the cosmic neutrino energy spectrum
- first sources of neutrinos
- and the answer is: supermassive black holes at the cores of active galaxies

IceCube neutrinos >100 GeV (one year shown)

(reaches neutrino purity of > 97% but overwhelmingly atmospheric)

~ 200 cosmic neutrinos

~12 separated from the atmospheric background with E>60 TeV

- maximize the (model agnostic) likelihood L at each point in the sky
- usually, add energy term to the signal likelihood S

$$L(n_s, x_s, \gamma) = \prod_{i}^{events} \left(\frac{n_s}{N} S_i(|x_i - x_s|\sigma_i, E_i, \gamma) + \frac{N - n_s}{N} B_i(\delta_i, E_i)\right)$$

$$S_i(|\vec{x}_i - \vec{x}_s|, \sigma_i) = \frac{1}{2\pi\sigma_i^2} \exp\left(-\frac{|\vec{x}_i - \vec{x}_s|^2}{2\sigma_i^2}\right)$$

Pick	Name	Class	$\alpha [\mathrm{deg}]$	$\delta [\mathrm{deg}]$	\hat{n}_s	$\hat{\gamma}$	$-\log_{10}(p_{local})$	door		PKS B1130+008	BLL	173.20	0.58	15.8	4.0	0.96	4.4

pre-trial p-value for clustering of high energy neutrinos

- hottest spot coincident with NGC 1068
- also hottest spot in the sources list (2.9σ)

statistical fluctuations or neutrino sources?

sub-leading sources: binomial analysis

- improved detector geometry
- each photomultiplier calibrated individually
- improved characterization of the optics of the ice
- improved muon angular resolution and energy reconstruction using machine learning
- point spread function consistent with simulation or, we were partially blind
- ...
 applied to 10 years of archival data (pass 2),
 data unblinded, result ...

- point spread function consistent with simulation
- insensitive to systematics

- ▶ Rayleigh (1D-projection of 2D Gauss) doesn't describe our Monte Carlo accurately → Tails are suppressed
- ▶ The distribution depends on the spectral index!
- ▶ Effect mainly visible at < 10 TeV energies where the kinematic angle between neutrino and muon matters
- Solution: Obtain a numerical representation of the γ-dependent spatial term from MC simulation (for example using KDEs)

$$\frac{1}{2\pi\sigma^2}e^{-\frac{\psi^2}{2\sigma^2}} \to \mathcal{S}(\psi \mid \sigma, E_{\mu}, \gamma)$$

Virtual Collaboration Meeting, 2020-09-22

pre-trial p-value for clustering of high energy neutrinos

- hottest spot coincident with NGC 1068
- also hottest spot in the sources list (2.9σ)

statistical fluctuations or neutrino sources?

the new IceCube neutrino map: hottest spot

1% of scrambled data sets have a spot ≥ 5.3**σ**

is the hot spot coincident with one of the 110 preselected sources?

80 high-energy neutrinos from the direction of the active galaxy NGC 1068

 $-\log_{10}(p_{\text{local}})$

- X-ray vs neutrino flux
- a correlation between the X-ray and neutrino flux of active galaxies producing neutrinos?
- X-ray flux of TXS 0506+056
 is consistent with this
 pattern: neutrinos are
 produced in the core, not
 the jet

(Emma Kun et al., Neronov et al.)

 two brightest active galaxies discovered by Seyfert in 1943

NUCLEAR EMISSION IN SPIRAL NEBULAE*

CARL K. SEYFERT†

1943

ABSTRACT

Spectrograms of dispersion 37–200 A/mm have been obtained of six extragalactic nebulae with high-excitation nuclear emission lines superposed on a normal G-type spectrum. All the stronger emission lines from λ 3727 to λ 6731 found in planetaries like NGC 7027 appear in the spectra of the two brightest spirals observed, NGC 1068 and NGC 4151.

binomial analysis: 3 active galaxies

Binomial Test

- Binomial Test: Probability of finding a signal from 47 AGNs too weak to be identified individually
- Result: 3.3σ excess for 11 sources (excluding NGC1068)

Loutring 2004

binomial test of X-ray bright Seyfert galaxies

IceCube 170922 290 <u>TeV</u>

from light in the ice to astronomer in less than one minute

MAGIC
detects emission of > 100 GeV gammas

IceCube 170922 290 TeV Fermi detects a flaring blazar within 0.06°

MASTER robotic optical telescope network: observing within 73 seconds optical flash after 2 hours: highest statistical association of TXS 0506 with IC170922

"MASTER found the blazar in the off-state after one minute and then switched to onstate two hours after the event. The effect is observed at a 50-sigma significance level"

optical flashes may
originate from
magnetohydrodynamical
instabilities triggered
by processes
modulated by the
magnetic field of the
accretion disk

- neutrino astronomy and the origin of cosmic rays
- IceCube
- the cosmic neutrino energy spectrum
- first sources of neutrinos
- and the answer is: supermassive black holes at the cores of active galaxies?

rays places
neutrino production
site in the heart of
the galaxy

a gamma ray for every neutrino?

NGC 1068: an obscured cosmic accelerator

- accelerator(s): electrons and protons are accelerated in the turbulent magnetic fields associated with the accretion disk, in the infall onto the black hole,...
- target: the neutrinos are produced in the optically thick core with a high density of gammas (corona X-rays) and dense clouds of hydrogen (protons)

cores of active galaxies

target densities required

- to produce the neutrino flux
- to suppress the flux of the accompanying gamma ray from π⁰s

requires a target density only found within < 100 Schwarzschild radii of the black hole

NGC 1068 core: large optical depth in photons (X-ray) and matter

$$au_{p\gamma} \sim \sigma_{p\gamma} \left[\frac{1}{\mathrm{R}} \, \frac{L_X}{E_X} \right]$$

cross section x target density = optical depth τ

$$\tau_{p\gamma} \sim 0.1 \rightarrow \text{PeV neutrinos}$$
 $\tau_{pp} \sim 1 \rightarrow 1 \sim 100 \,\text{TeV neutrinos}$

$$E_X = 1 \, \text{keV} \; ; \; L_X \sim 10^{43} \, \text{ergs}^{-1}$$

neutrinos originate within 10~10² Schwarzschild radii from the BH

neutrinos are produced inside the dark matter spike at the center of the Galaxy

neutrino astronomy 2024

- it exists
- more neutrinos, better neutrinos, more telescopes
- closing in on cosmic ray sources a century after their discovery

18 Jun 2024

Uncharted Territory

- Significant event observed with huge amount of light
- Horizontal event (1° above horizon) as expected since earth opaque to neutrinos at PeV scale
- 3672 PMTs (35%) were triggered in the detector
- Muons simulated at 10 PeV almost never generate this much light
 - Likely multiple 10's of PeV

18 Jun 2024 81

Uncharted Territory

- Light profile consistent with at least 3 large energy depositions along the muon track
- Characteristic of stochastic losses from very high energy muons

18 Jun 2024 82

Event 132379/15947448-2 Time 2019-03-31 06:55:43 UTC Duration 22596.0 ns

5947448-2 IceCube Preliminary 1 06:55:43 UTC 0 ns

IceCube's Highest Energy Event:

11.4 PeV (3 with $E_{v} > 10 \text{ PeV}$)

^{*}Most probable neutrino energy when assuming a BPL spectrum $(\gamma_1, \gamma_2)=(1.72, 2.84)$ [Data Release]
