

## Cosmic rays from Galactic star clusters

*Tuesday 29 October 2024 12:10 (30 minutes)*

In this contribution, I will discuss about a model for the production of cosmic rays from massive, young star clusters present in the Galaxy. I will show that cosmic-ray acceleration at the shocks associated with fast stellar winds of star clusters can produce significant contribution in cosmic rays at energies  $\sim 10^{16} - 10^{18}$  eV. When combined with the contribution from regular supernova remnants in the Galaxy and an extra-galactic component, cosmic-rays from star clusters can reasonably explain the observed all-particle spectrum and composition of cosmic rays.

**Presenter:** THOUDAM, Satyendra

**Session Classification:** Particle acceleration and propagation
