

GALACTIC ARCHAEOLOGY

WITH
MACHINES

AND
NOVEL DATA

Yazan Al Momany, Sara Lucatello, Jose Luis Schiapacasse, Lorenzo Spina, Antonella Vallenari (INAF-Padova)
Giulia Martos (INAF-Padova, Universidade de Sao Paulo)
Lorenzo Cavallo, Nagaraj Vernekar (UniPD)
Laura Magrini (INAF-Arcetri)
Leda Berti (UniFi)
Mario Pasquato (INAF-Brera)

Galactic Archaeology

Photometric and
astrometric data

Motion
of stars

Spectroscopic
data

Chemical
composition,
ages

Evolution of elements
within the Galaxy
across space and time

Galactic Archaeology

- How was the Milky Way assembled?
- What was the role of past mergers with surrounding dwarf galaxies?
- How are elements synthesised in stars and recycled throughout the Galaxy?
- How have the present-day stellar populations formed?
- How do stars migrate across the Galaxy?
- How similar is our Galaxy in comparison to the other spirals in the Universe?

Novel Data

During the current decade our field will be hit by a tsunami of completely new, huge and complex data

...and many more

Exploiting the full potential of this enormous dataset

Being able to analyse a magnitudes larger flux of data

Opportunity to change the means and methods of our analysis
Hypothesis-driven \longrightarrow Data-driven

Spectroscopic analysis with Neural Networks

Nagaraj
Badarinarayan
Vernekar
(UniPD)

Sara
Lucatello

Lorenzo
Spina

Artificial Neural Networks for the fast analysis of stellar spectra.

About 10^3 time faster than classical analysis.

Bridging the synthetic gap

Neural-Nets learn from models.
What if we contaminate their knowledge with some real observations?

Models

Assume a spherical cow in the vacuum

VS

Reality

Towards the highest precision possible

Giulia Martos
(Sao Paulo)

Sara Lucatello

Lorenzo Spina

Artificial Neural Networks for the fast analysis of stellar spectra.

About 10^3 time faster than classical analysis.

High-precision in chemical abundances for detecting chemical signatures of planet engulfment events.
(also see Silvano's talk)

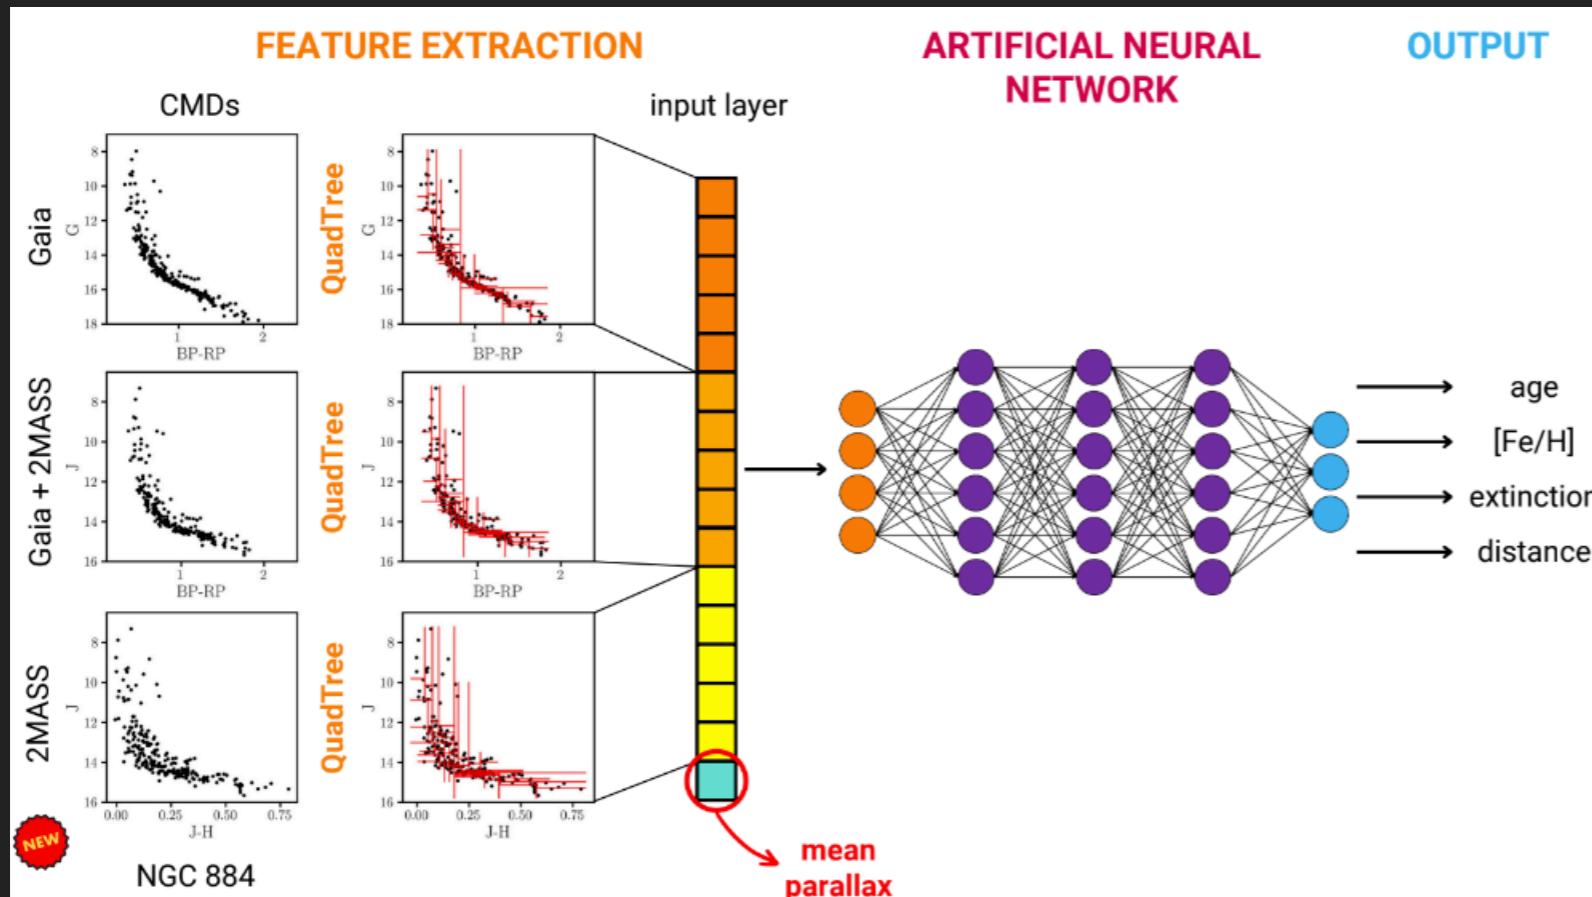

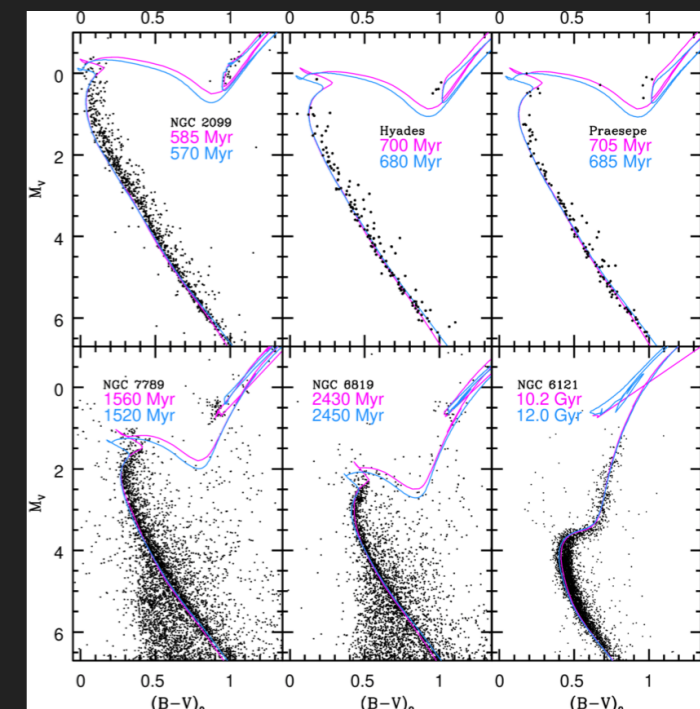

Demography of Stellar Clusters

Lorenzo Spina

Lorenzo Cavallo (UniPD)

Reassembling the building blocks of the Milky Way

Laura
Magrini
(Arcetri)

Leda
Berni
(UniFi)

Lorenzo
Spina

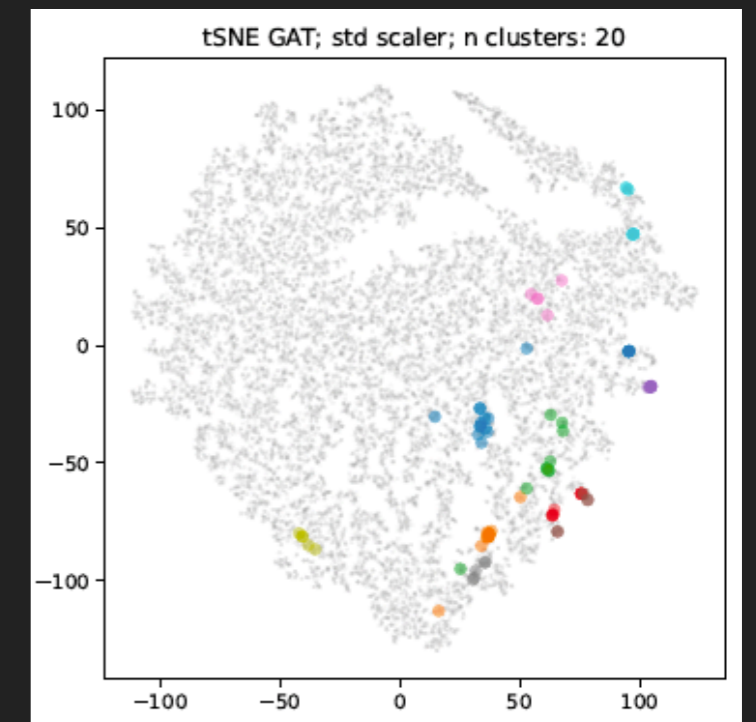

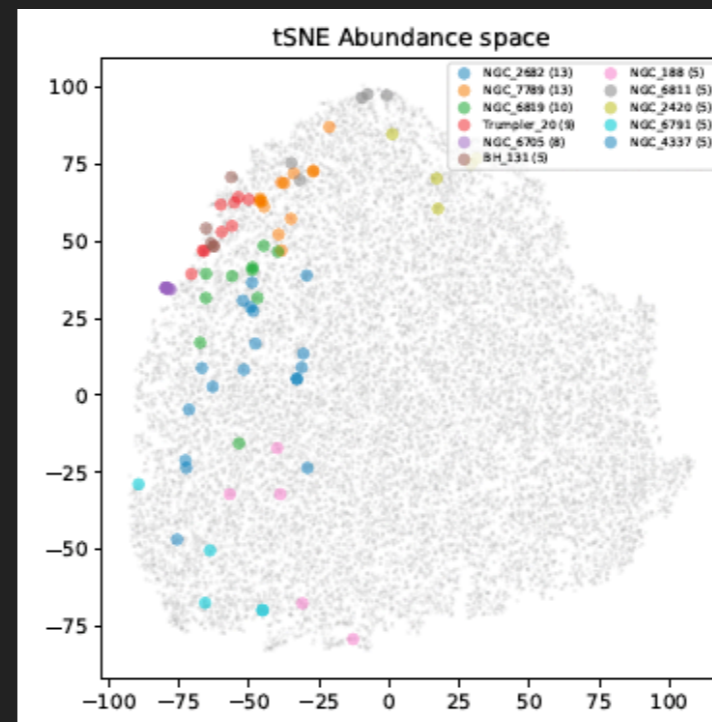

Stars formed from the same environment
have similar chemical composition

Can we use chemical composition to
trace stars back to their original orbits?

Pioneering the application of Graph Neural Networks,
invented in 2018, in Galactic Archaeology

Looking for stars that should not exist

"Serendipity" is a category at the intersection between chance and wisdom.

(Copeland S., 2017, "On serendipity in science")

Huge
datasets

We will observe stars not predicted by any model
and so rare that they have never been observed so far

Their detection is
not so obvious

It is by finding anomalous stars that we
can learn the most physics.

Anomaly detection techniques applied to
stellar spectroscopy.

Conclusions

Machine Learning is fully transferable to a broad range of fields

- Graph Neural Networks applied to planetology
finding geological species on planet Mercury
- Anomaly detection techniques applied to adaptive optics
real-time corrections of undesired behaviours

Thank you!
