Introduction of Our Group

"In observing the changes, we realize that the heavens and earth cannot be contained in a single moment; in observing the constants, we understand that all things, including ourselves, are boundless." ---Su Shi, "Ode to the Red Cliffs."

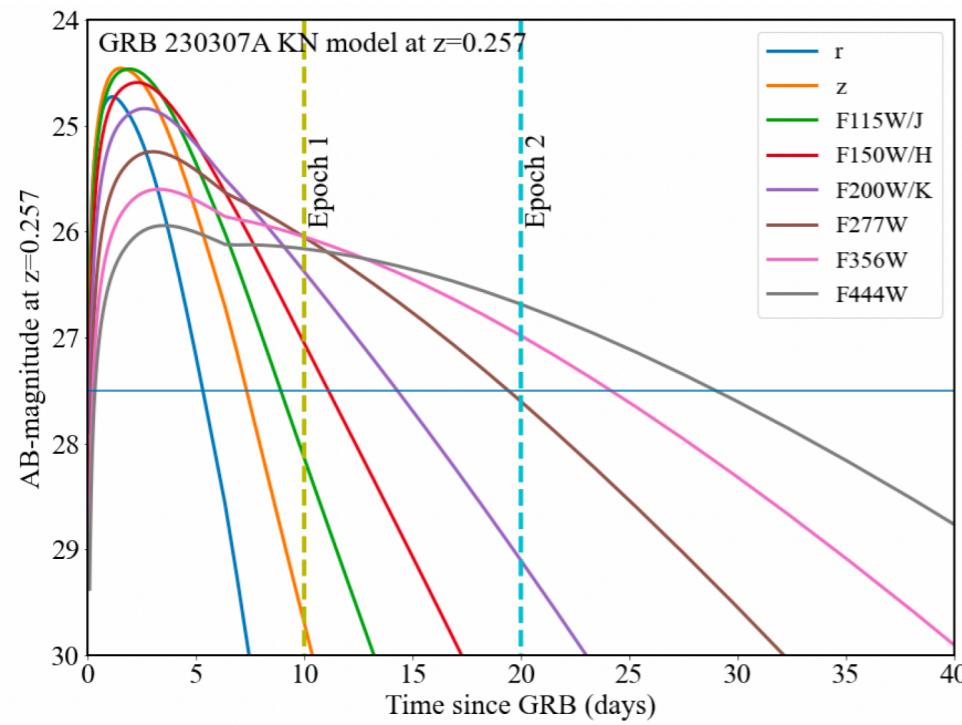

The Universe is filled with dazzling and spectacular celestial explosions. When do they occur? Why do they happen? Where do these eruptions take place? And what unfolds after their occurrence?

有同好分享，超新星目前已經亮到13星等了！

昨天發現那顆在鄰近星系NGC 3621的超新星SN 2024ggi，目前已經亮於14星等！

持續變亮中！如果有同好有使用標準濾鏡觀測這顆超新星的話，歡迎跟我聯絡
喔！！！感謝大家。

Keywords: [Transient](#)

Abstract: We present the early-phase photometry of SN 2023ixf based on images obtained from amateur astronomers and school observatories in Taiwan. Our collected light curve, spanning from 2023-05-20 to 2023-05-21, exhibits a clear rising trend of approximately 2 magnitudes for SN 2023ixf.

We have provided the instrument configuration details and the converted PS1 r magnitude of SN 2023ixf in the table below:

Date	Time (UT)	MJD	Converted r mag	Observer(s)	Filter	Telescope	Instrument	Exp (sec)
2023-05-20	13:35	60084.566	13.4 +/- 0.2	Chia-Ming Chang, Yen-Hsing Lin, Shih-Ping Lai	Luminance	SHOWA 250mm F/12 Refractor	ZWO ASI 6200MM Pro	300

types are not exactly the same, they are mostly consist with each other.

• 700nm, and the *RGB* filters roughly equally divide the wavelength range. These images were reduced under the standard CCD reduction and flat calibration. After removing the instrumental bias, we fit the photometry zeropoints against SkyMapper photometry system. We also compare our photometric measurements with Gaia star catalogs and SkyMapper source catalogs. We then convert the measurements of different instruments to SkyMapper photometry system by solving the following equation:

$$m_{citi} - m_{sm} = C_0 + C_1 (g - r)_{sm},$$

$$m_{citi} - m_{sm} = C_0 + C_1 (g - r)_{sm} + C_2 (g - r)_{sm}^2$$

citizen science images and SkyMapper magnitude, respectively, and C_2 is coefficient of the quadratic term. For the r filter, we find

$$-r_{sm} = -0.20 + 0.63 (g - r)_{sm} - 0.19 (g - r)_{sm}^2, \text{ rms} = 0.08$$

$$-r_{sm} = -0.27 + 0.72 (g - r)_{sm}, \text{ rms} = 0.11$$

$$-g_{sm} = -0.20 + 0.760 (g - r)_{sm}, \text{ rms} = 0.07$$

$$-i_{sm} = 0.02 - 0.02 (r - i)_{sm}, \text{ rms} = 0.08,$$

the EQMOD system:

Work with citizen scientists for SN 2023ixf

the iTeslaope 33 system:

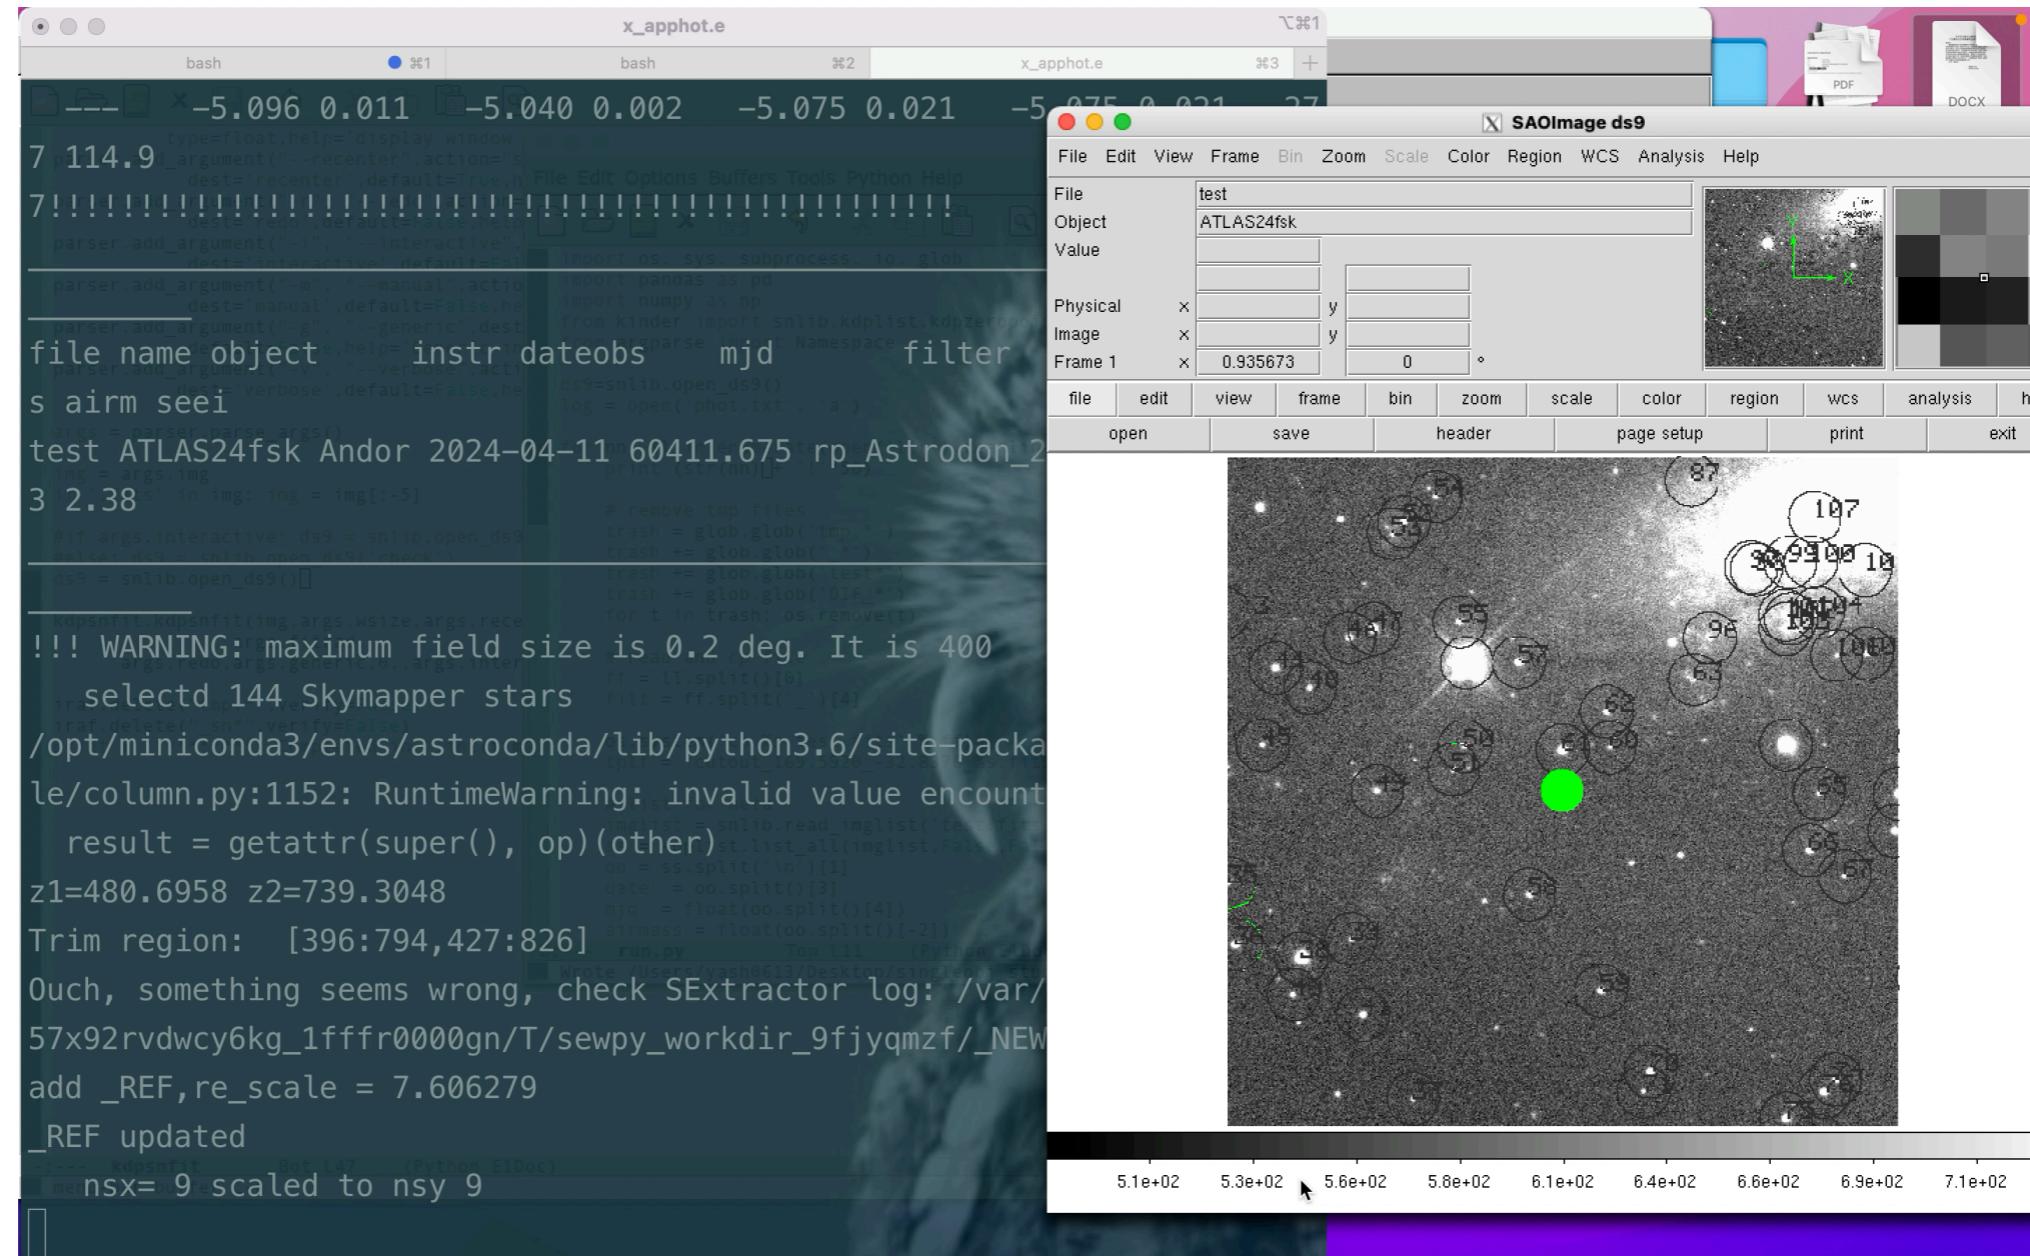

$$L - r_{sm} = -0.13 + 0.38 (g - r)_{sm}, \text{ rms} = 0.18$$

$$R - r_{sm} = 0.07 - 0.17 (g - r)_{sm}, \text{ rms} = 0.04$$

$$G - r_{sm} = -0.29 + 0.79 (g - r)_{sm}, \text{ rms} = 0.05$$

$$B - g_{sm} = -0.25 + 0.72 (g - r)_{sm}, \text{ rms} = 0.05,$$

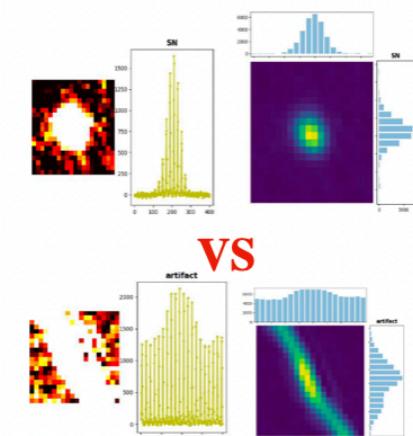

Kinder pipeline has measuring 1000 data points!

Light curves of SN 2024ggi

Early monitoring is crucial

No significant discrepancies were observed between the data and fits, suggesting an absence of SBO features. While this could result from observational limits, it may also imply the presence of a dense, extended CSM around the RSG based on (u-g) colour.

Based on early-phase light curves, we selected the best matching model from Moriya et al. (2023). This model features an explosion energy of 2×10^{51} erg, a mass-loss rate of $10^{-3} M_\odot/\text{yr}$ (assuming a 10 km/s wind), a confined CSM radius of 6×10^{14} cm, $\beta = 4.0$, and a CSM mass of $0.4 M_\odot$.
