

## **Porting of VisIVO Visual Analytics on HPC-type computing infrastructure**

We present the latest developments of VisIVO Visual Analytics, an interactive visualization tool that is evolving to meet the needs of the SKA and similar large-scale astrophysical projects. Originally designed as a desktop application, VisIVO is transitioning to a client-server architecture, allowing it to efficiently run remote visualization pipelines on remote servers. This shift also enable the ability to distribute computational workloads across multiple nodes in high-performance computing (HPC) clusters for parallel visualization pipelines.

**Presenter:** TUDISCO, Giuseppe (Istituto Nazionale di Astrofisica (INAF))

**Session Classification:** WP3
