The Primordial Universe SWG

Leads: Eduardo Bañados, Marco Castellano, Rebecca Bowler

Work Packages:

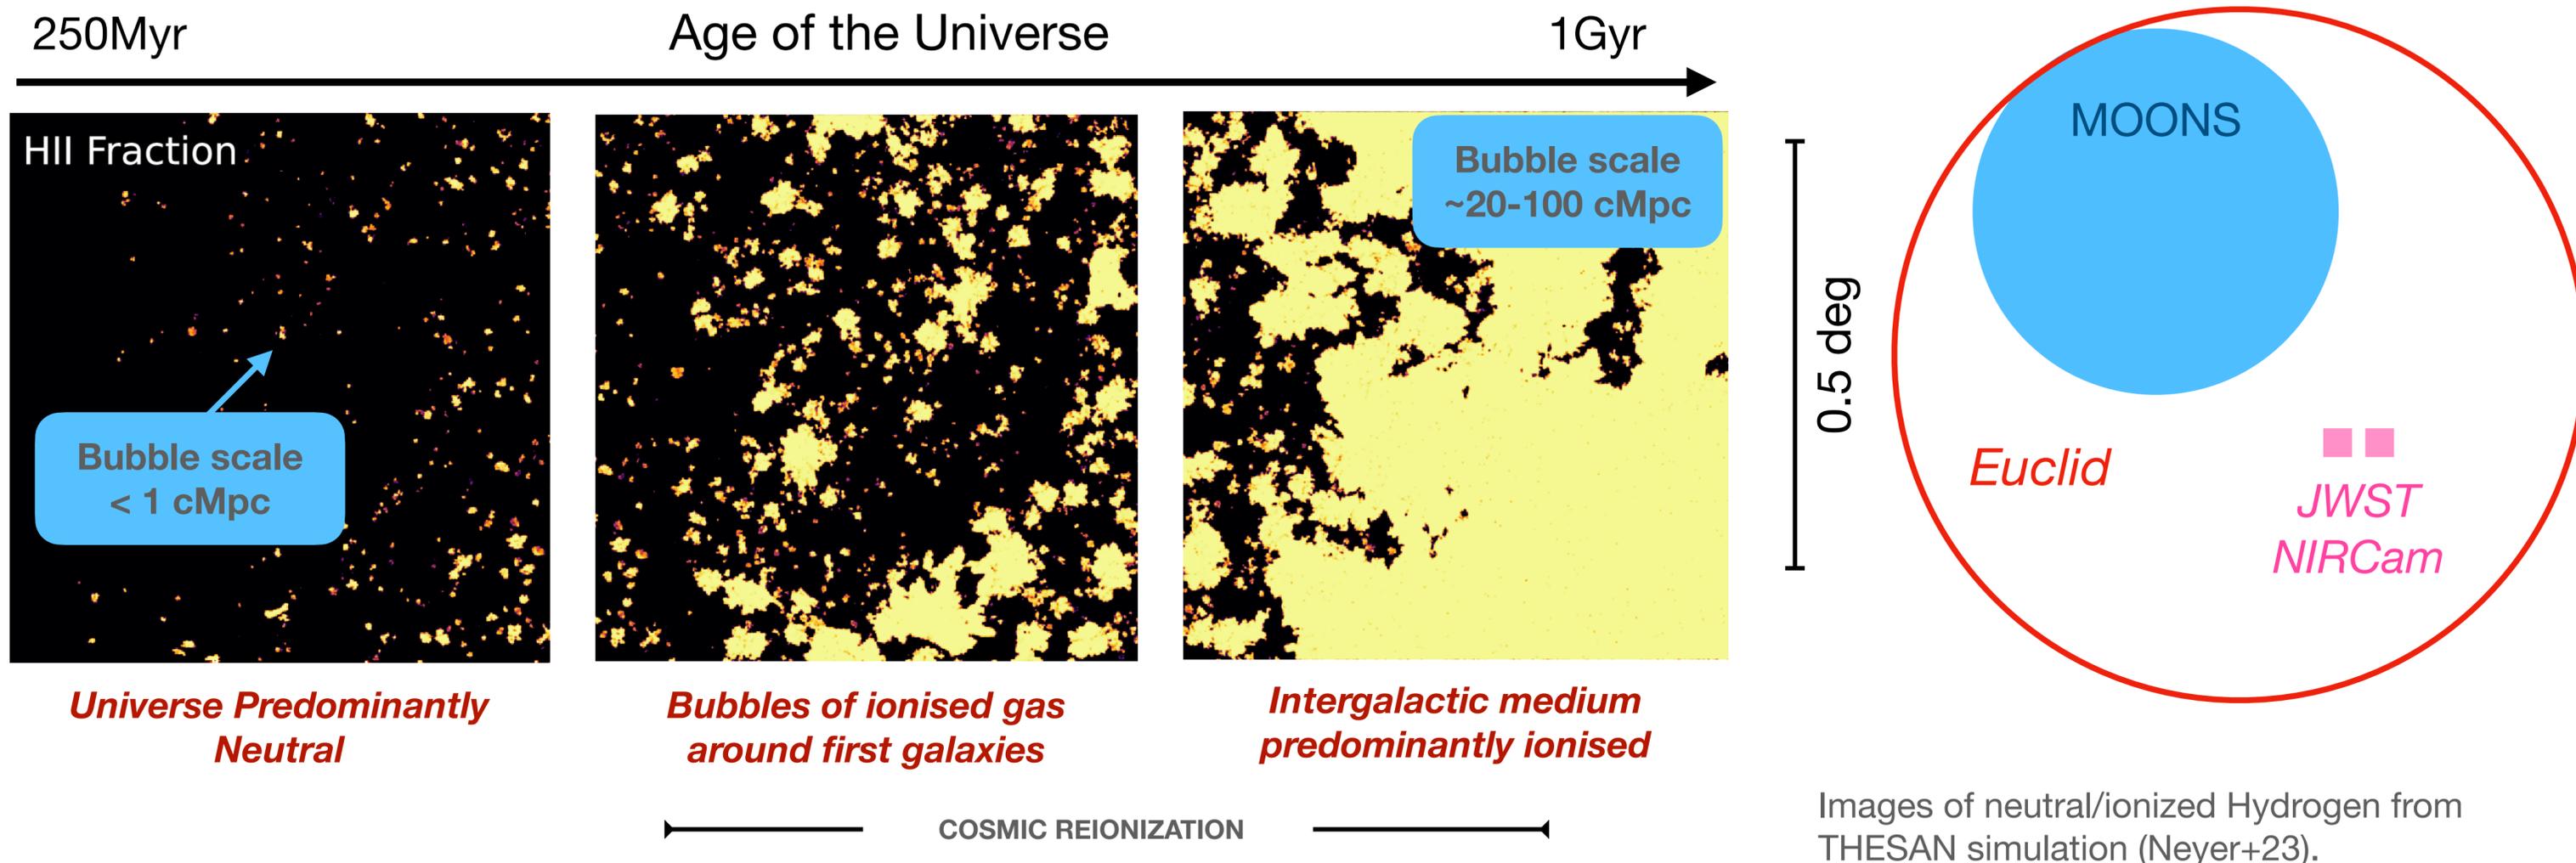

- Quasars (WIDE/DEEP high-z)
Leads: Schindler, Mortlock
- Galaxies (DEEP, LAE & LBG)
Leads: Oesch, Weaver
- Theory (re-ionization)
Leads: Dayal, Ferrara
- Cosmic Infrared Background
Leads: Kashlinsky
- Lensing (number counts & search strategies)
Leads: Cooray, Serjeant

The power of *Euclid* data at $z > 7$

- Euclid will provide the first statistical samples of galaxies within cosmic reionization on the expected (evolving) scale of ionised bubbles

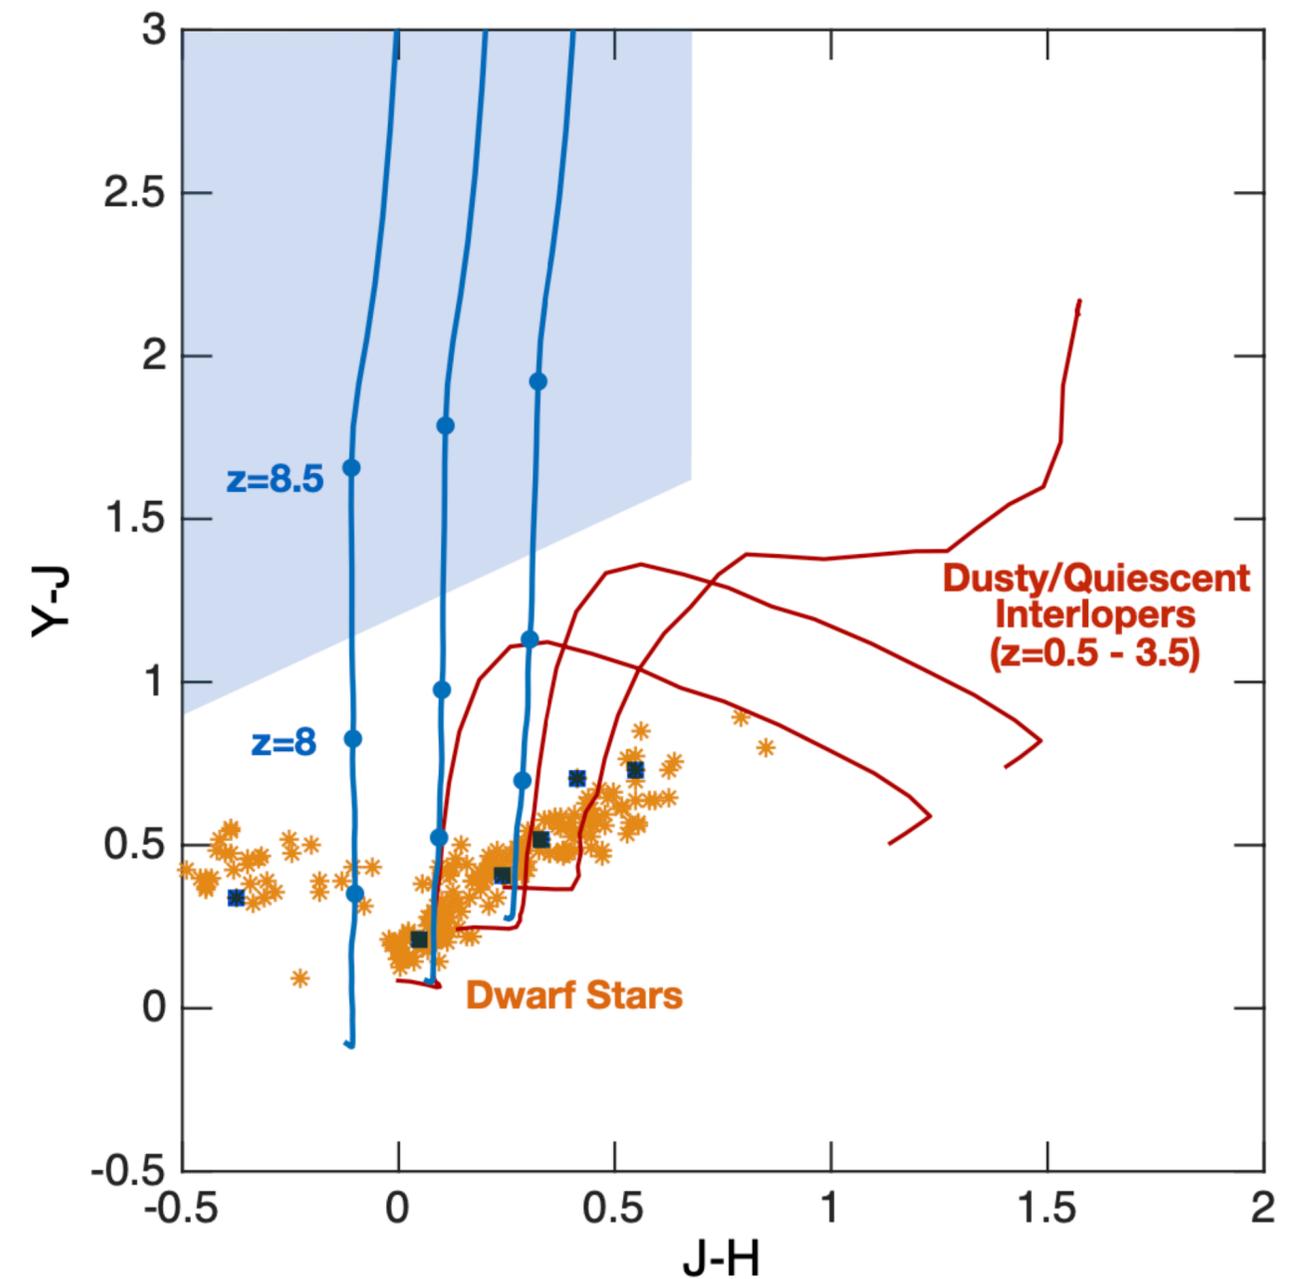

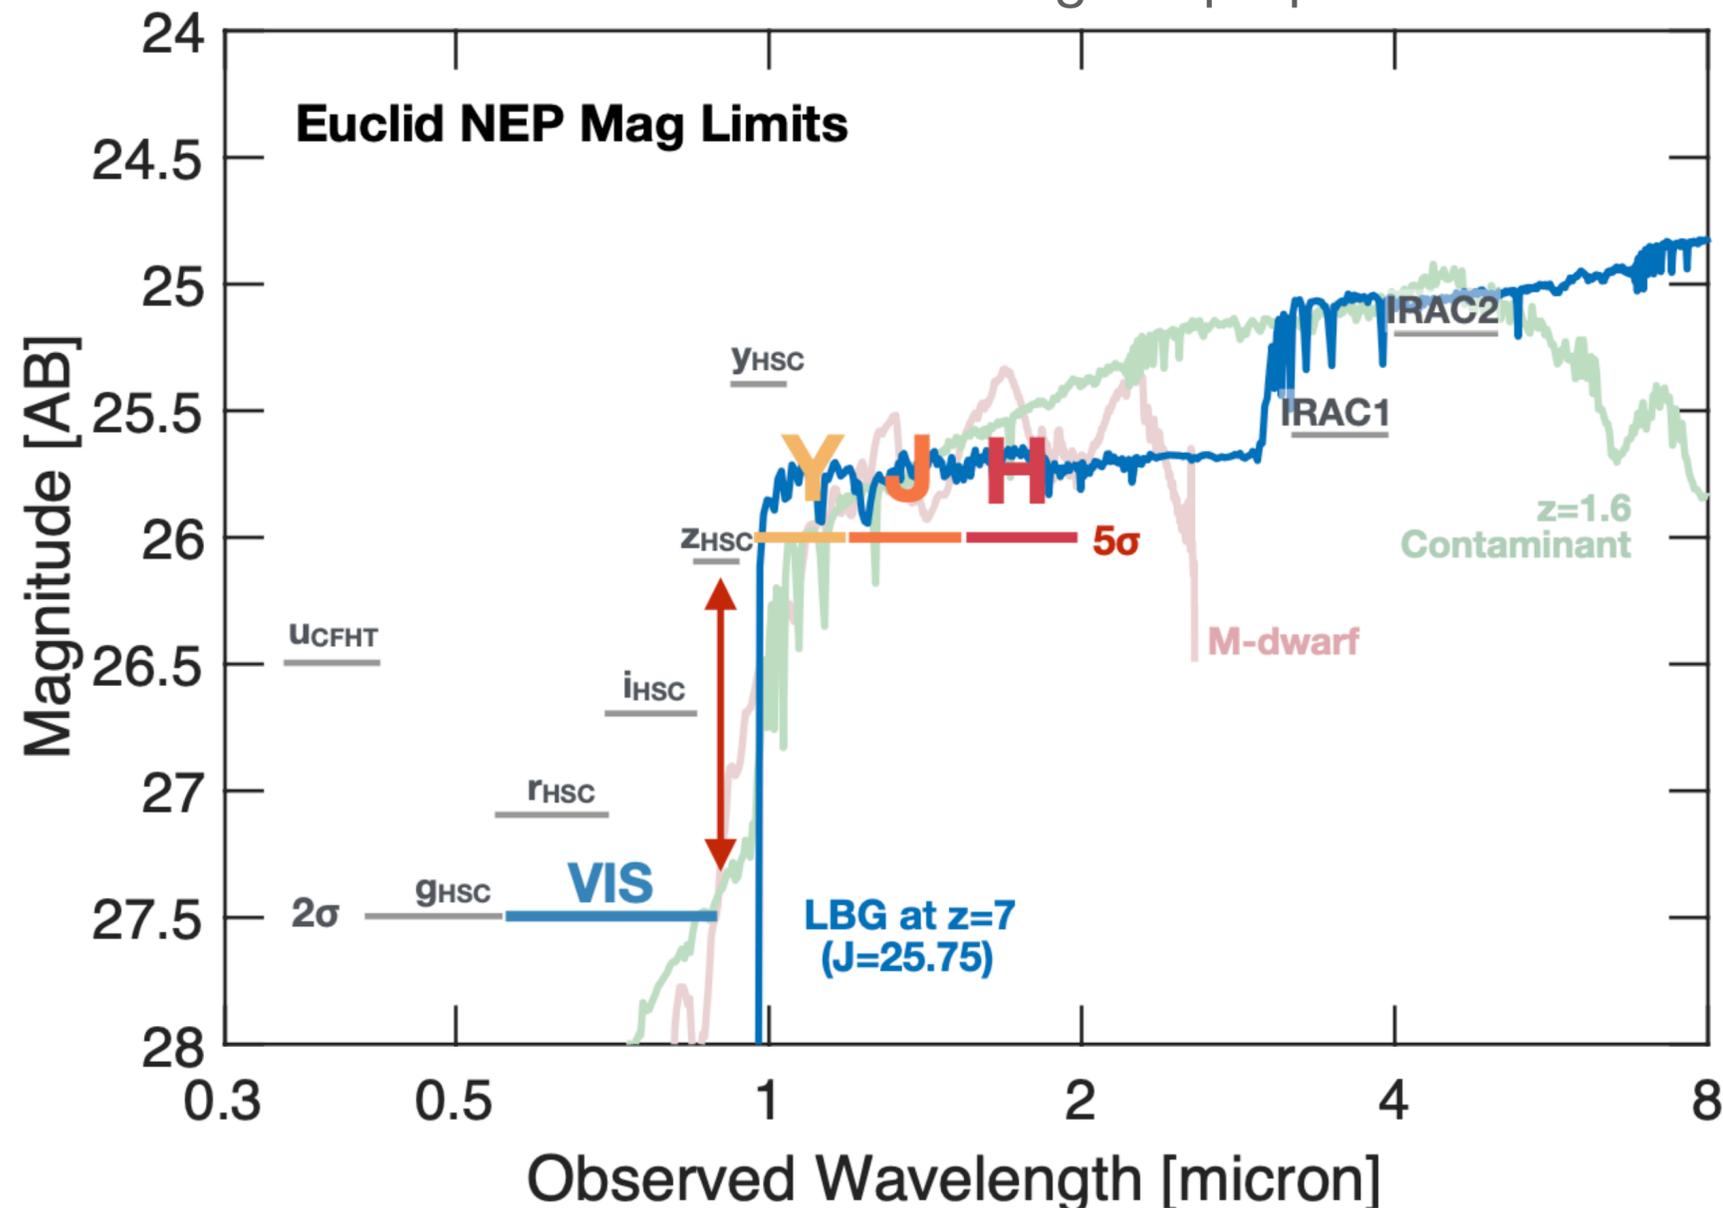

Bright galaxies (Euclid) 230cMpc = 1.5deg Faint galaxies (JWST)

Lyman break selection of $z > 7$ galaxies and quasars

See van Mierlo et al. 2022, Allen et al. 2025 in prep.

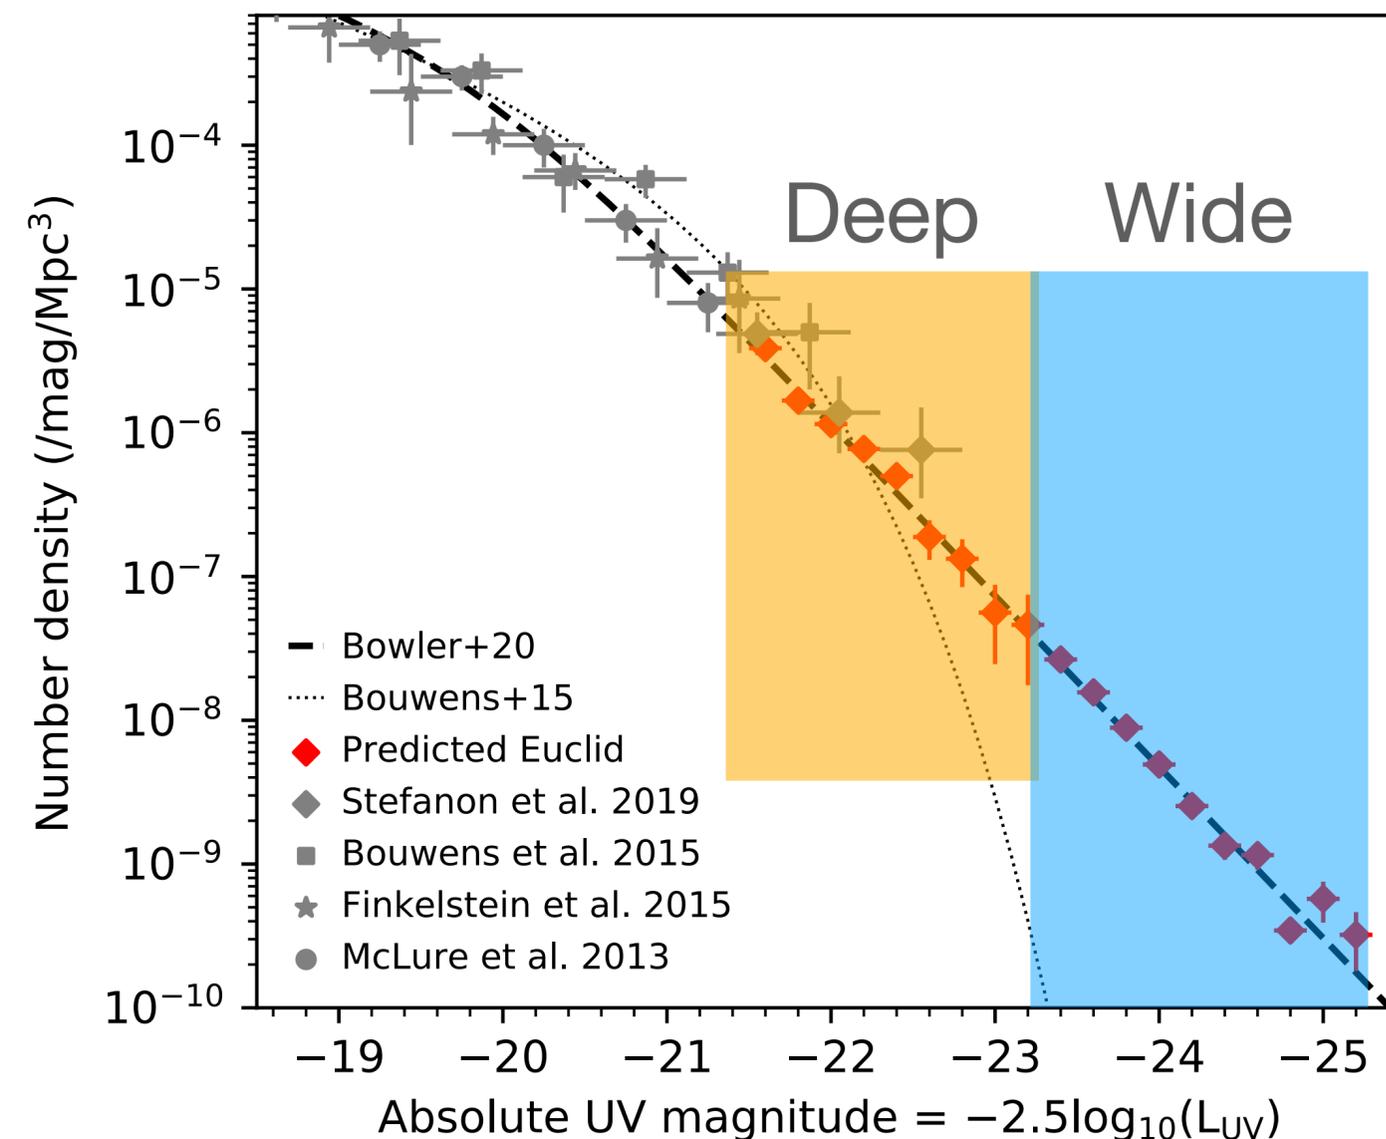

Selection including deep optical data H20

Lyman-break Galaxy Work Package

Credits R. Bowler

- Survey of high-redshift ($z > 7$) galaxies identified from *Euclid* VIS+YJH data in combination with deep auxiliary data
- Focus on the Deep survey
- Predict ~ 3000 - 4000 galaxies at $z = 8$ and ~ 80 - 500 galaxies at $z = 10$ (for Schechter vs. double-power law function)
- Samples probe bubble scale and high-density regions in cosmic reionization

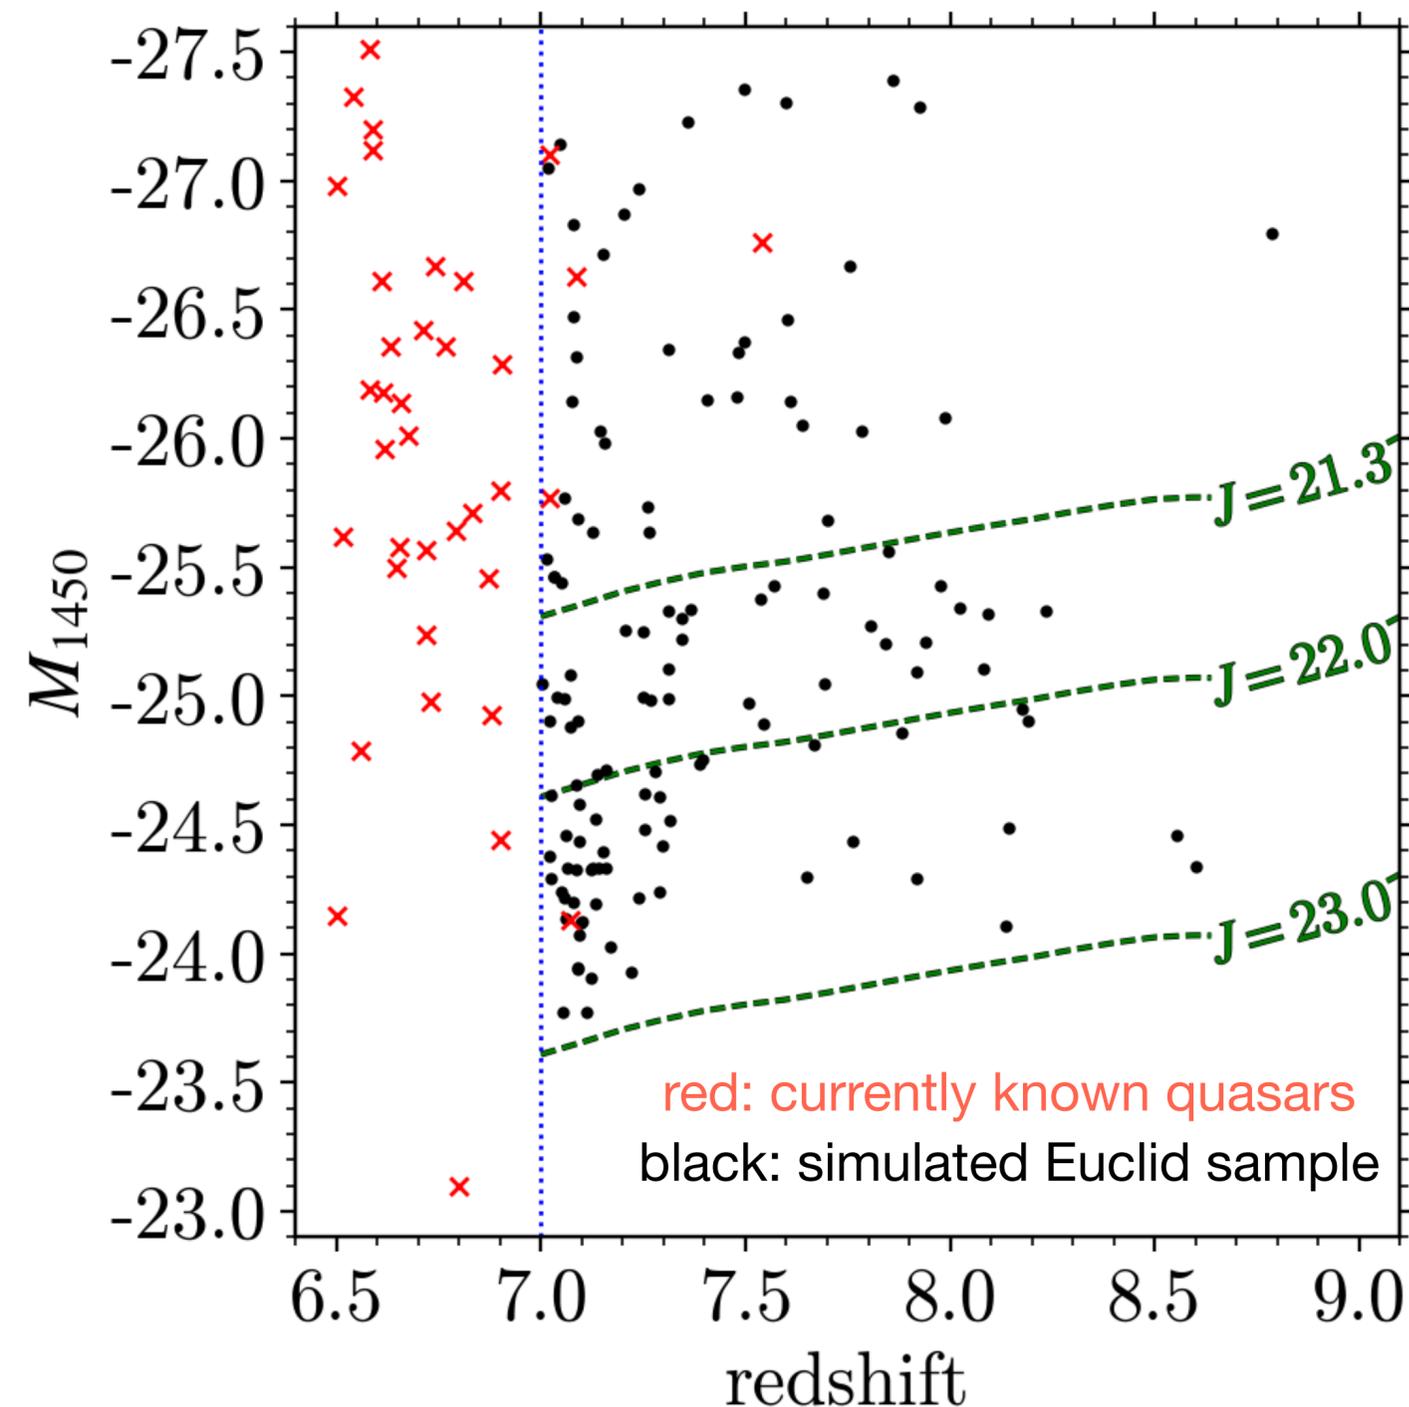

Simulated luminosity function at $z = 8$ (630 Myr) that will be derived from the EDF + EWF (R. Bowler)

Quasars Work Package

- Survey of high-redshift ($z > 7$) quasars identified from Euclid VIS+YJH photometry and red grism spectra
- Predominantly in the Wide survey
- Predict ~ 100 quasars with $z > 7$ and ~ 20 with $z > 8$ (EC, Barnett et al. 2019)
- Likely to break the current redshift record of $z = 7.6$ in DR1

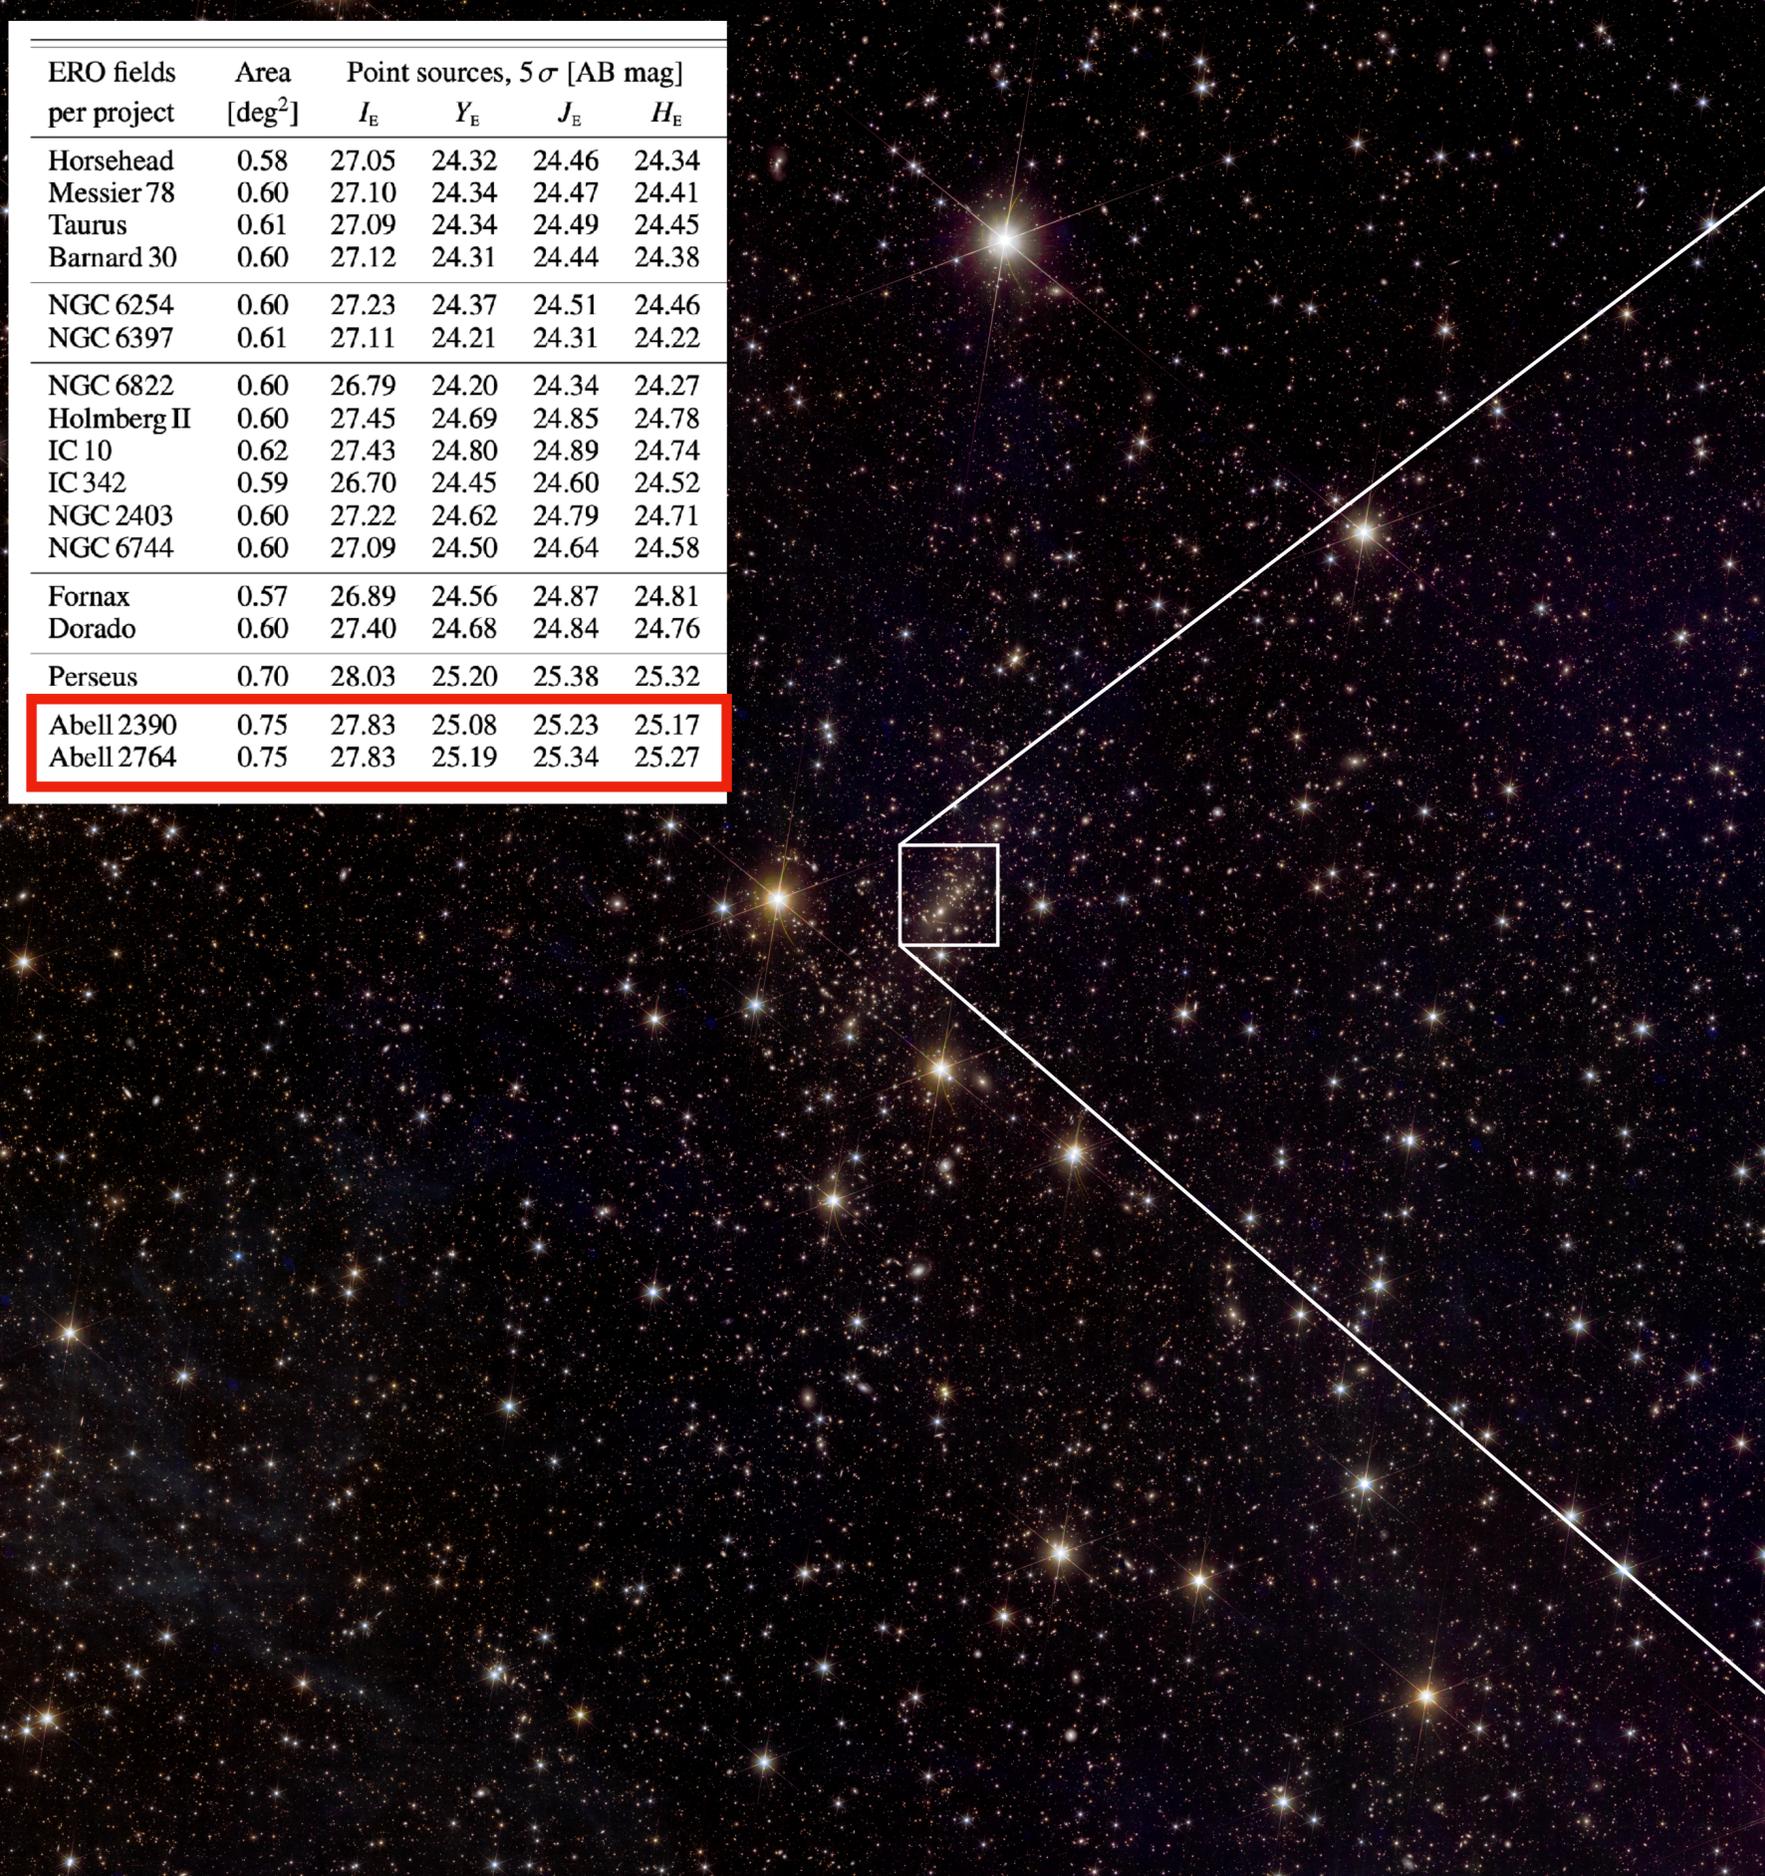

Figure of absolute UV magnitude vs. redshift
Euclid Collaboration: Barnett et al. 2019

First results using :

- Early Release Observations (ERO)
- On the Fly (OTF) data
- Quick release Q1

ERO fields per project	Area [deg ²]	Point sources, 5σ [AB mag]			
		I_E	Y_E	J_E	H_E

VIS Dropouts

Atek et al. 2024, Weaver et al. 2024

- 29 Lyman-break galaxy candidates selected, plus 139 “extremely red sources” likely at lower redshift

Field	RA [deg]	Dec [deg]	I_E	Y_E	J_E	H_E
A2390	328.397	+17.709	27.01	25.18	25.22	25.12
A2764	5.713	-49.249	27.26	25.30	25.41	25.21

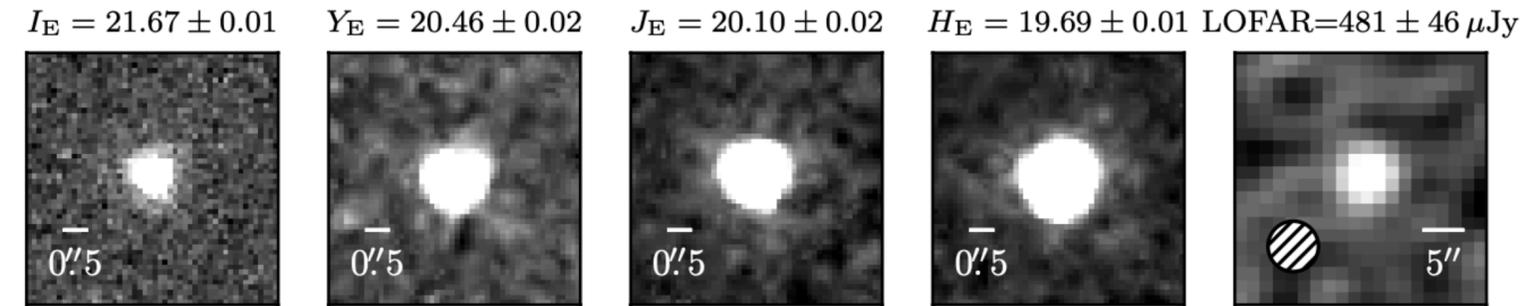

On-the-fly data

Includes Euclid + ground-based z-band + WISE W1/W2

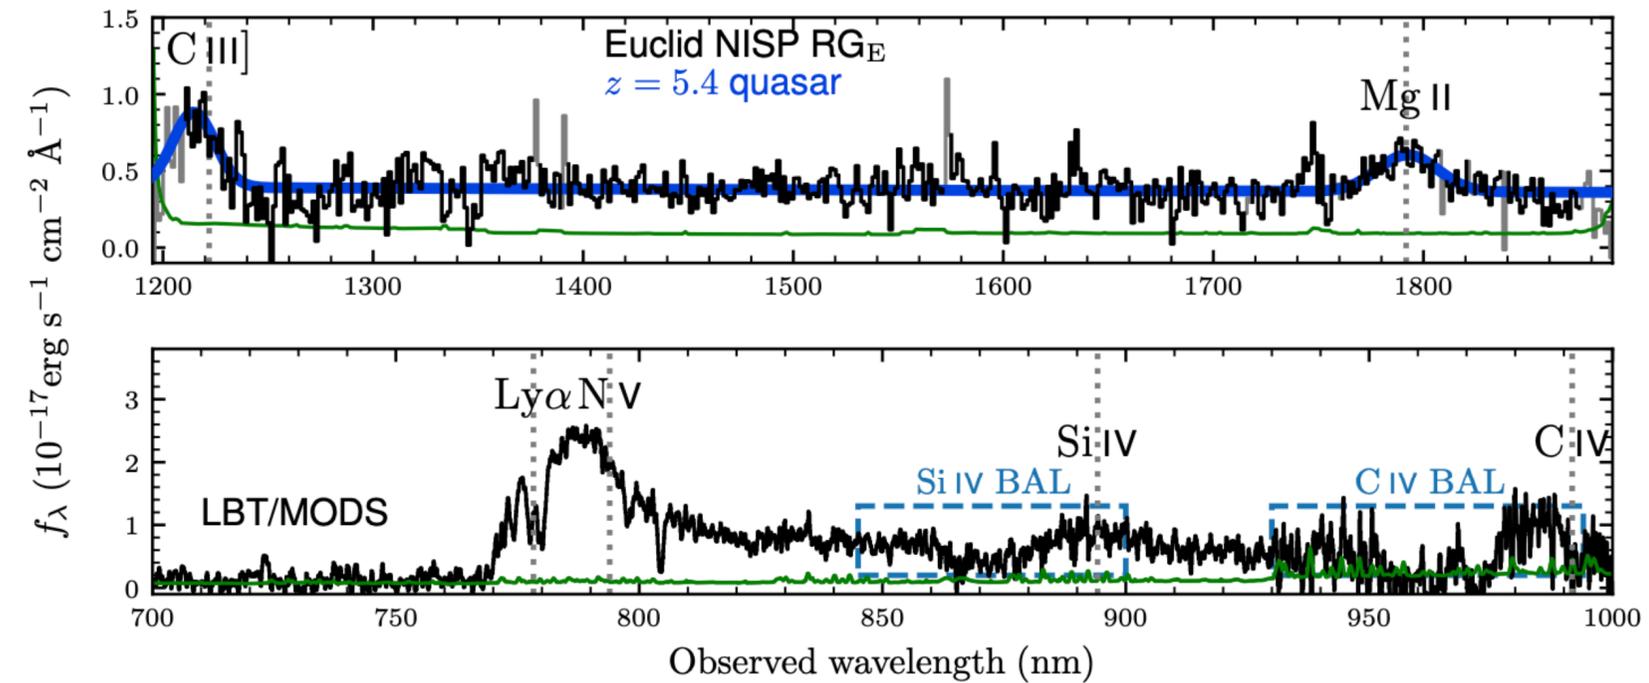

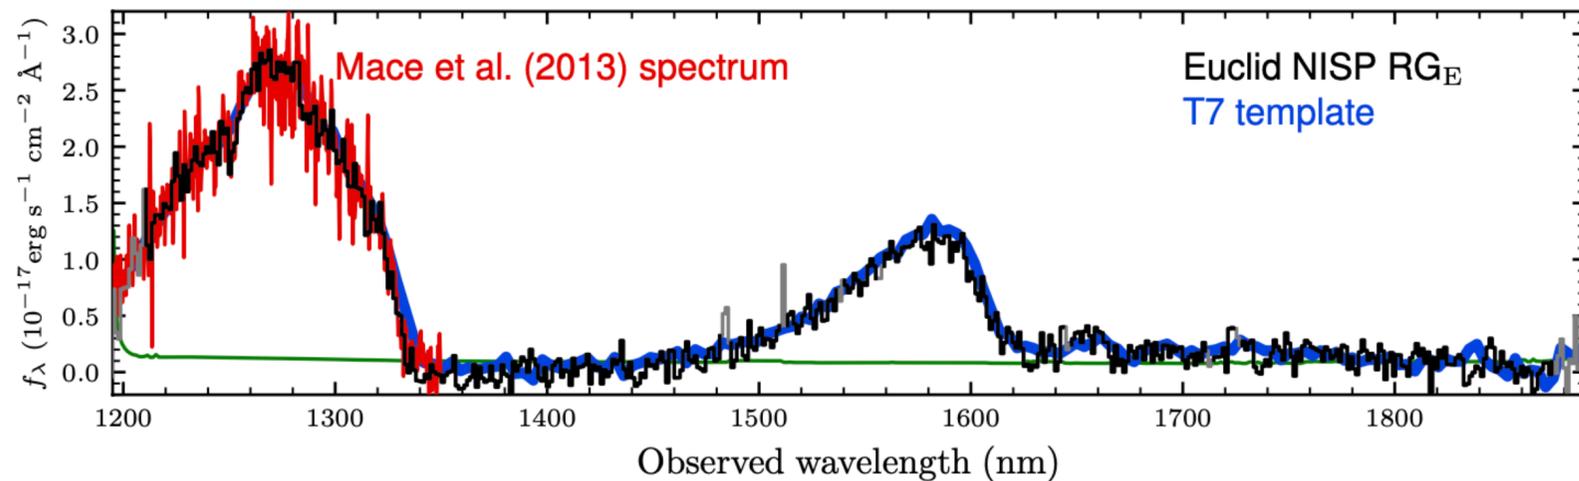

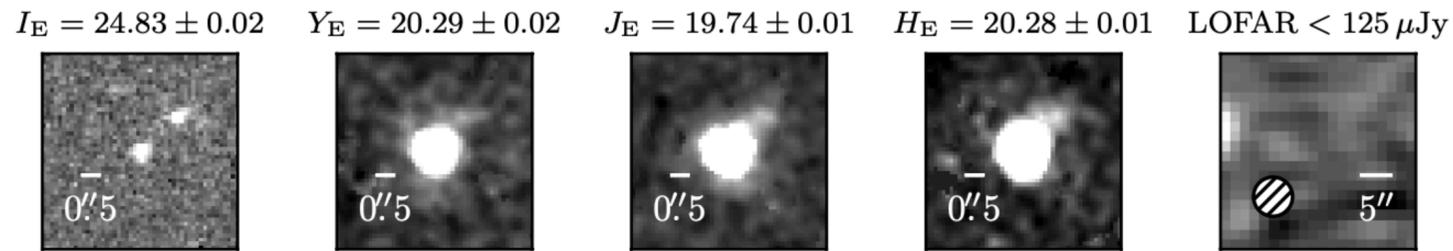

- ~8 follow-up proposals written, with 6 successful
- Magellan observations (PI: J. Yang) have recently identified five quasars with $z = 6.6-7.2$

Banados et al. submitted to A&A

A bright quasar at $z=5.4$ with NISP Grism and ground-based follow-up spectroscopy

LT Cool dwarves from NISP grism spectroscopy

Q1: Predicted numbers of high-z galaxies

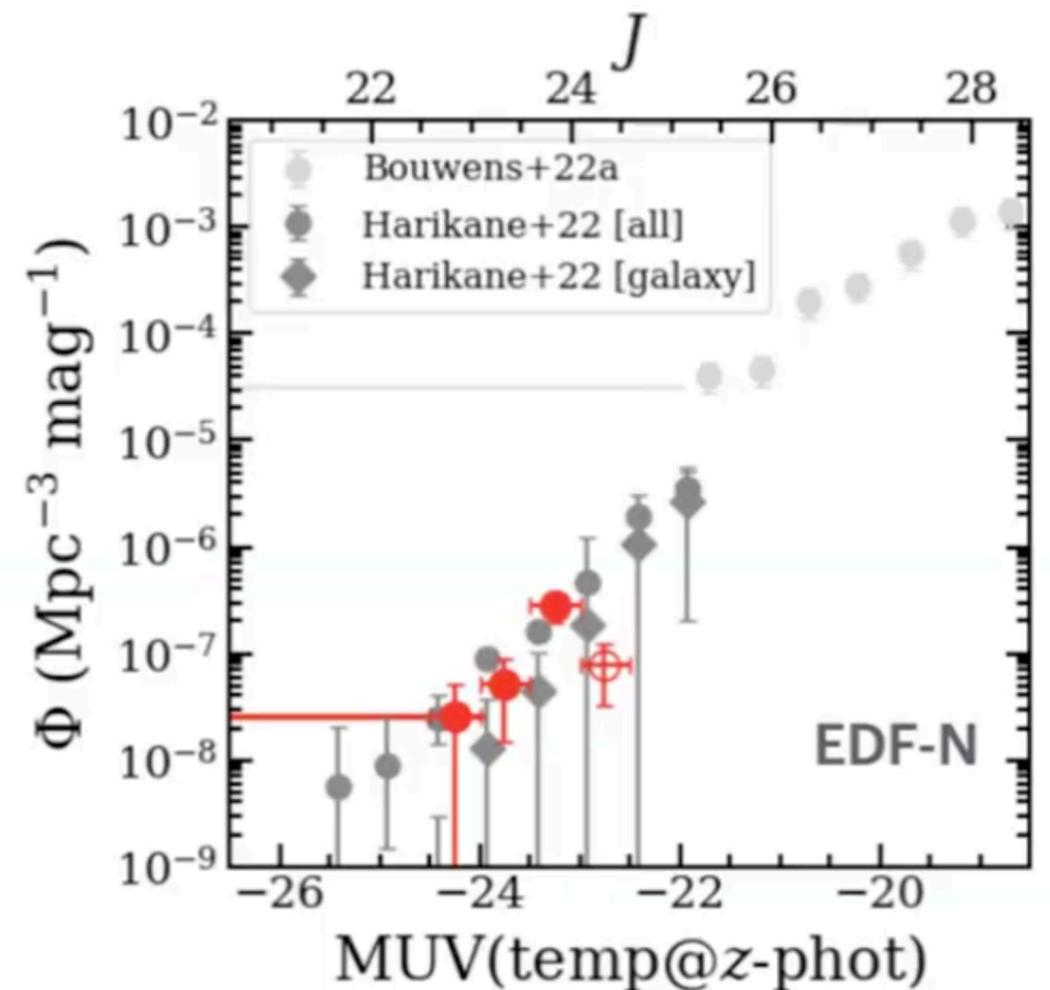

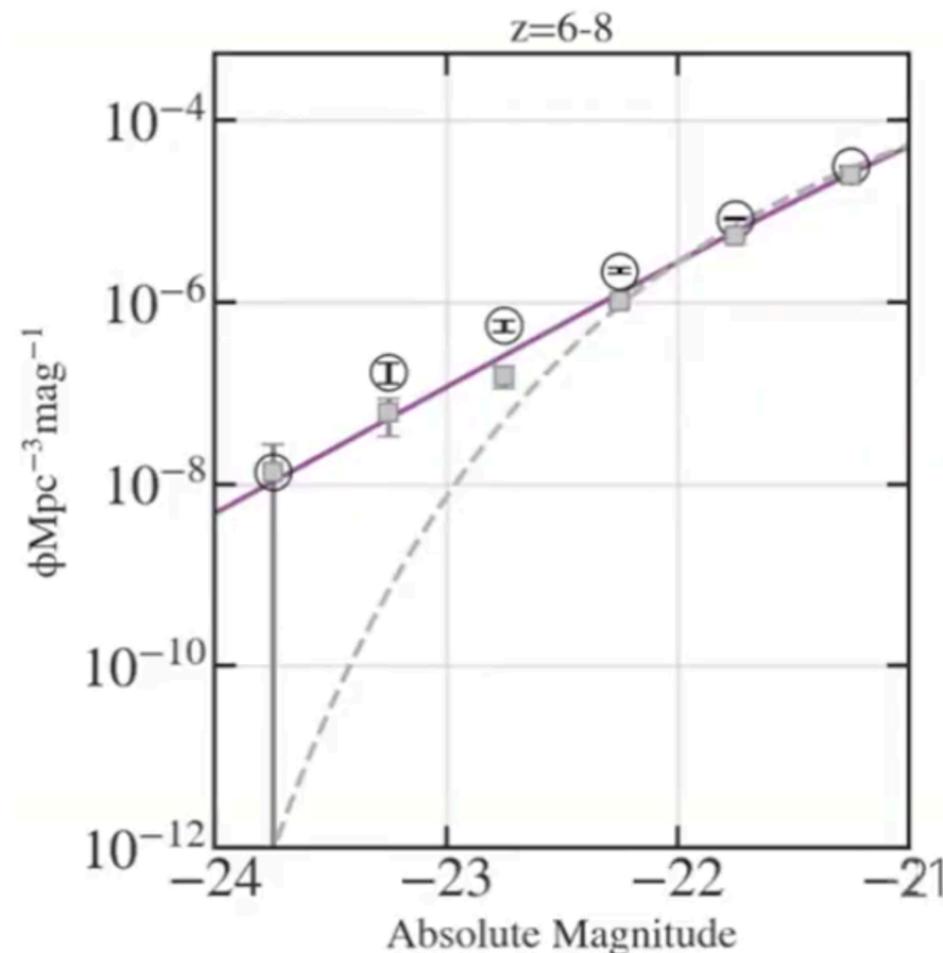

Allen et al. Q1 paper

Mock catalogs of $z > 5$ galaxies and contaminants, at the full survey depth, EDF-N, EDF-S, EDF-F

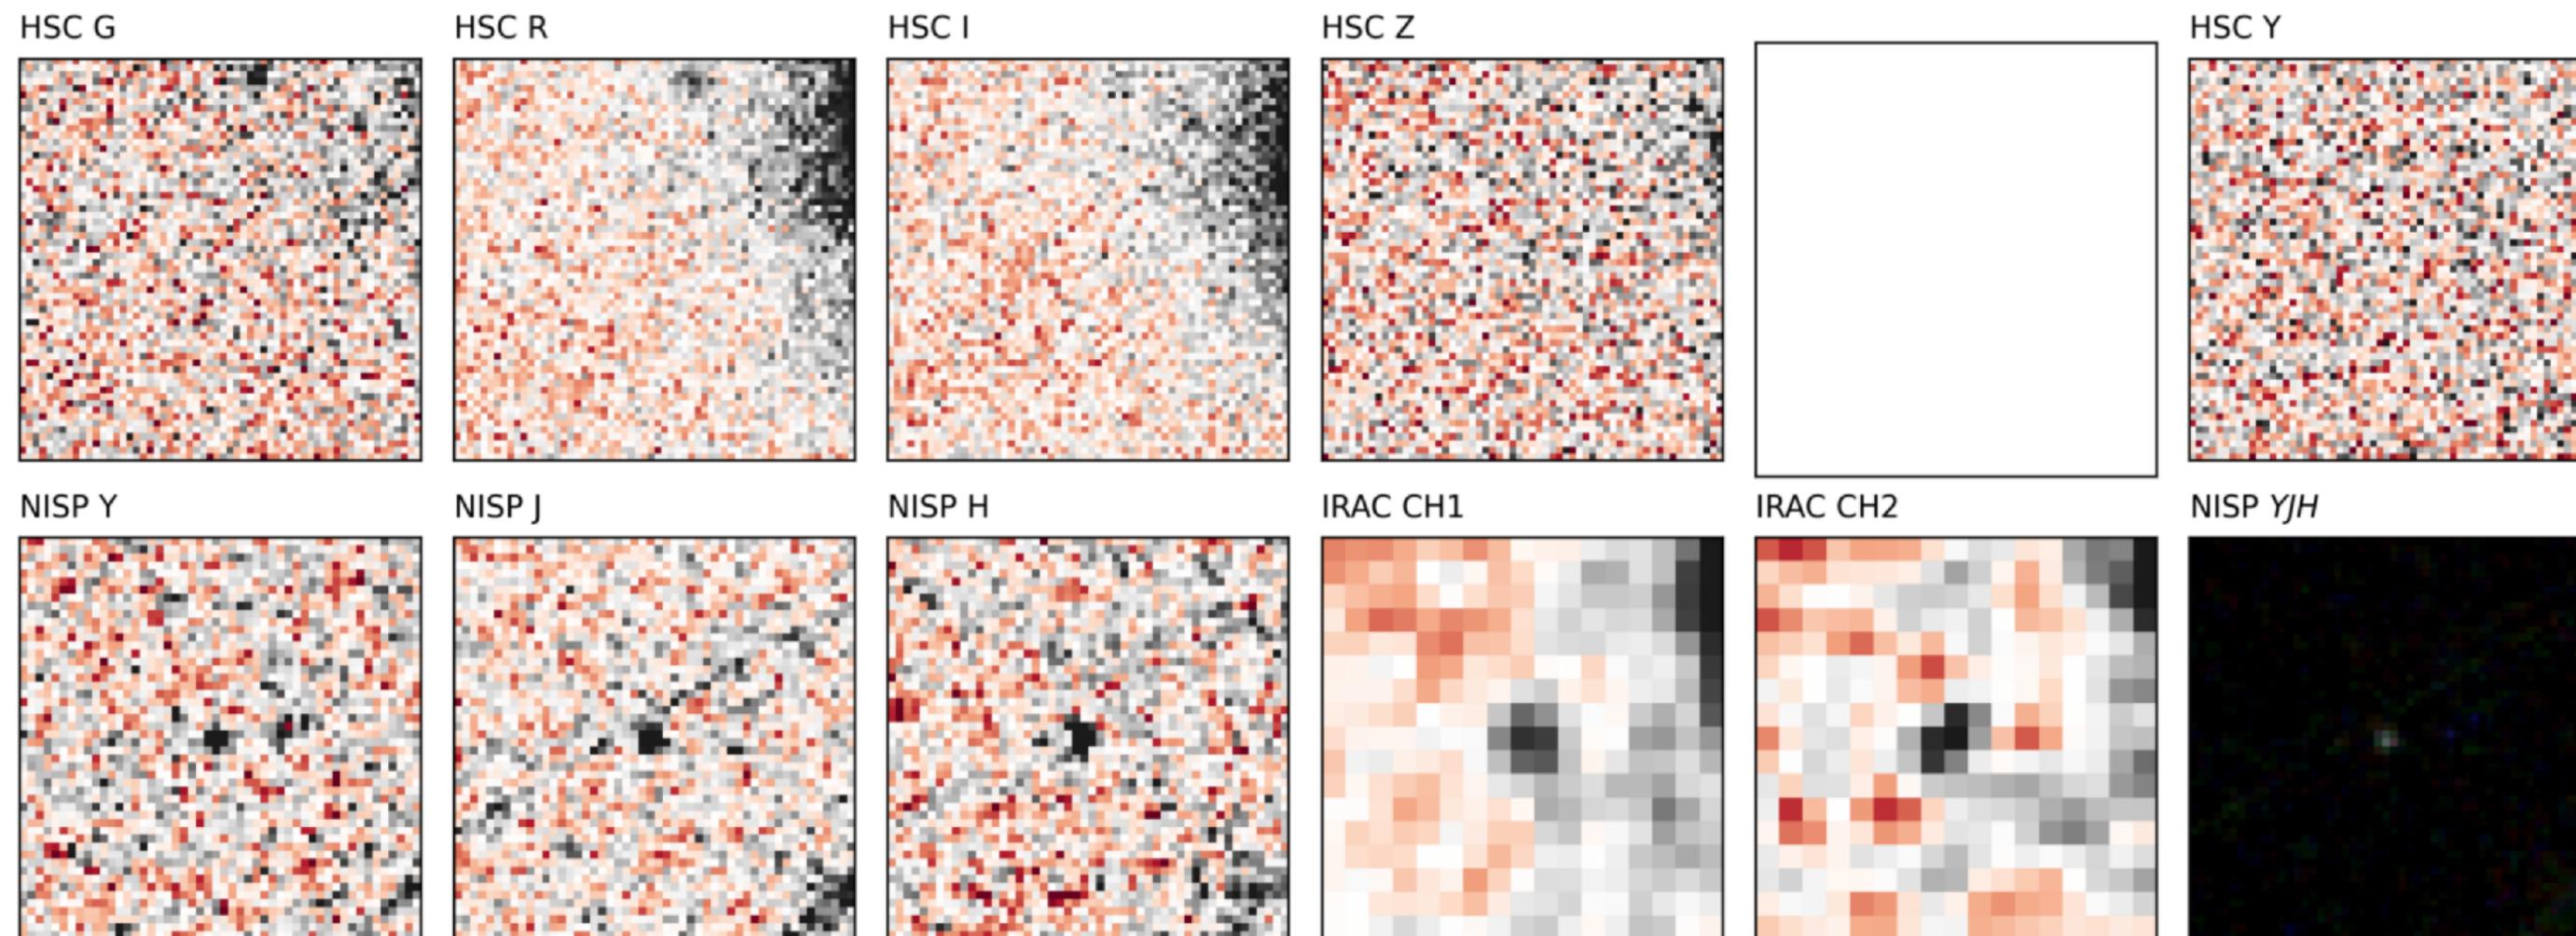

Photometric redshifts using Eazy. Better constraints on the bright-end of the UVLF

First robust candidates from Q1 data

z	EDF-N	EDF-S	EDF-F
6	58575	67361	29287
7	11621	13365	5811
8	2633	3028	1316
9	960	1104	480
10	391	449	195
11	176	203	88
12	87	101	44
13	47	54	24
14	28	32	14
15	17	20	9

Q1: search for high- z galaxies in EDFN

- Q1 analysis (led by John Weaver) has focused on the Euclid Deep Field North where there exists Spitzer/HSC data from the Cosmic Dawn Survey

DR1 Key Projects

- **DR1-KP-PU-1: The statistical and physical properties of $z > 7$ galaxies from Euclid**

Christopher Conselice
Marko Shuntov

- **DR1-KP-PU-2: Properties of Lyman alpha emitters at $z > 6.5$ and constraints on the reionisation history**

POSITIONS OPENED

- **DR1-KP-PU-3: Discovery of high redshift Euclid quasars**

Daniel Morlock
Jan Torge Schindler
Daming Yang

- **DR1-KP-PU-4: Characterising the quasar population with Euclid**

MERGED WITH PU-3

- **DR1-KP-PU-5: Multi-wavelength follow-up of Euclid quasars**

Silvia Belladitta
Eduardo Banados

- **DR1-KP-PU-6: Euclid constraints on reionisation and galaxy formation models**

IDLE

- **DR1-KP-PU-7: Euclid observations of the Cosmic Infrared Background**

Asantha Cooray, POSITION FOR 2nd COORDINATOR OPENED

Ongoing application/selection process for DR1 papers:

coordination between WP and KP leads to select 1st wave of paper leads by the end of September

29 papers proposed so far for DR1

The Primordial Universe SWG

- Euclid is a goldmine for the very high-redshift universe: more efficient than any other instrument to find bright Lyman-break galaxies and NIR-selected QSOs at $z \sim 7-12$.
- Synergy with other instruments, in particular ground-based spectroscopy and JWST.
- Mostly proof-of-concept papers and preparatory studies from ERO and OTF data, but we expect a huge impact on high- z science from forthcoming works:
- Three papers in progress for the second Q1 wave; two OTF SP in progress (LBGs and QSO spectroscopic confirmations at $z > 7$); we expect many DR1 papers.
- Issues: delay in the ingestion of data in the OTF archive (important for QSO searches and follow-up proposals); coordination with other SWGs needs to be strengthened.
- Italian point of view: several researchers involved but few leadership roles (community still more focused on JWST? lack of dedicated funding?)

BACKUP SLIDES

Q1: search for high- z galaxies in EDFN

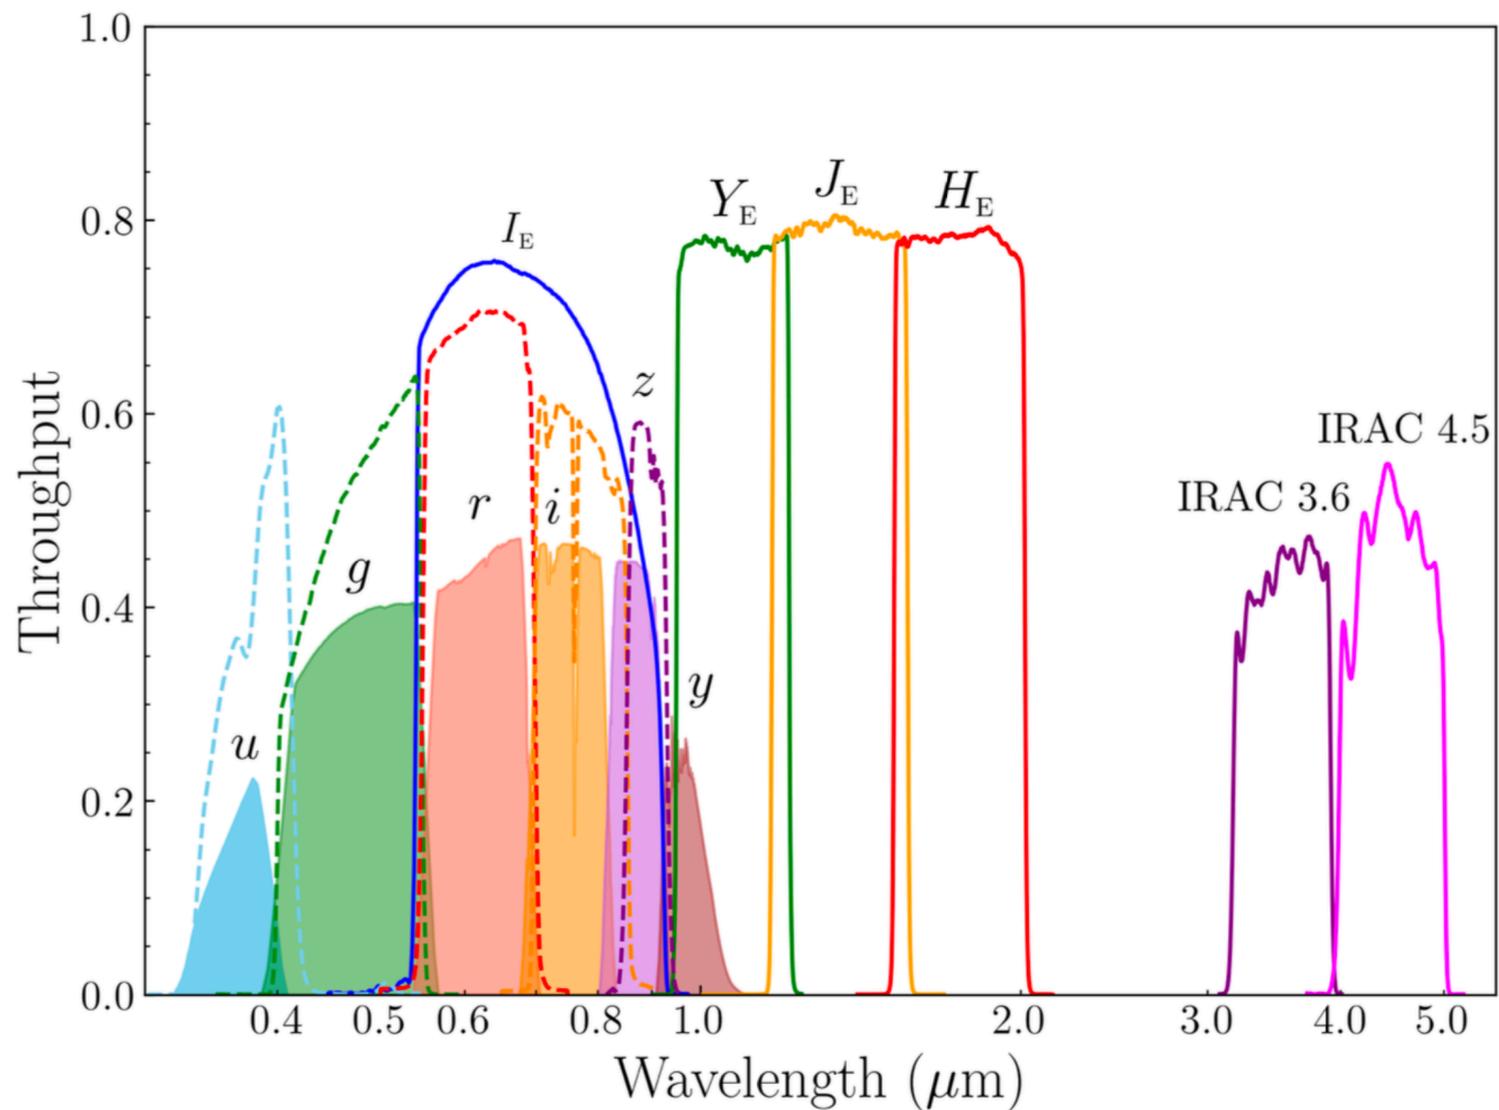

- Lyman-break galaxy selection has uncovered 73 candidates over 10 square degrees
- These sources are selected with photometric redshifts
- If confirmed, they would be the brightest galaxies known at $z > 7$
- At these magnitudes, faint $z > 7$ quasars could “contaminate” the galaxy samples - TBC!

Weaver et al. in prep

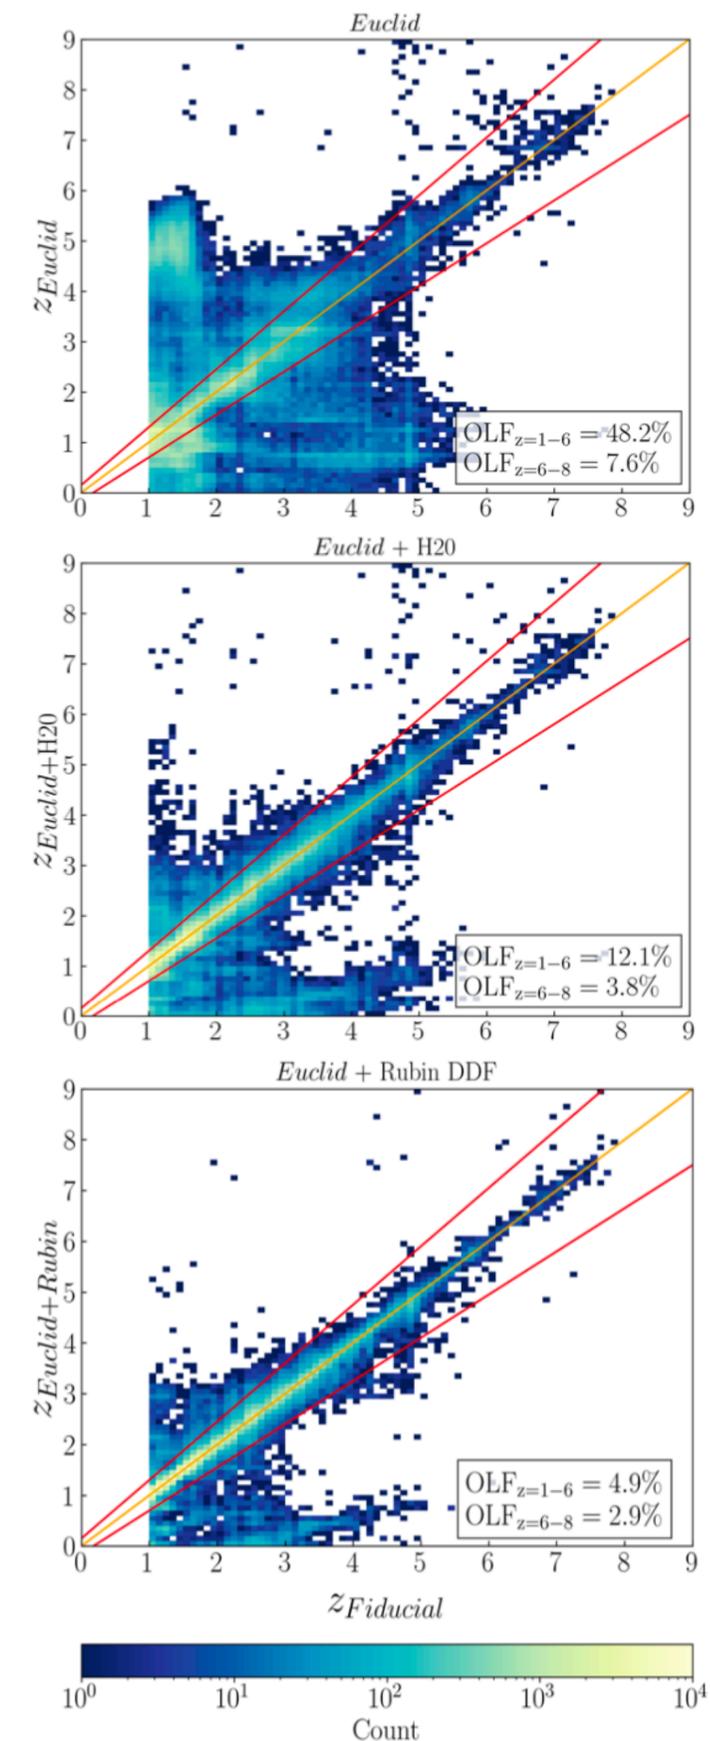

Euclid + Ancillary Data

Van Mierlo et al. 2022

Band	5σ depth [AB]	λ_{mean} [\AA]
I_E	28.2	7140
Y_E	26.3	10 829
J_E	26.5	13 696
H_E	26.4	17 762

IRAC/3.6 μm	24.8	35 634
IRAC/4.5 μm	24.7	45 110

Strong Lensing Work Package

- Search for bright strongly-lensed $z > 7$ galaxies in *Euclid* imaging and in blue and red grism spectroscopy
- Very rare sources that will be the brightest known ultra-high-redshift galaxies on the sky
- Contamination a key issue, including by a new numerous population of lensed red sub-mm galaxies*
- Current algorithms not sufficient, visual selection still required

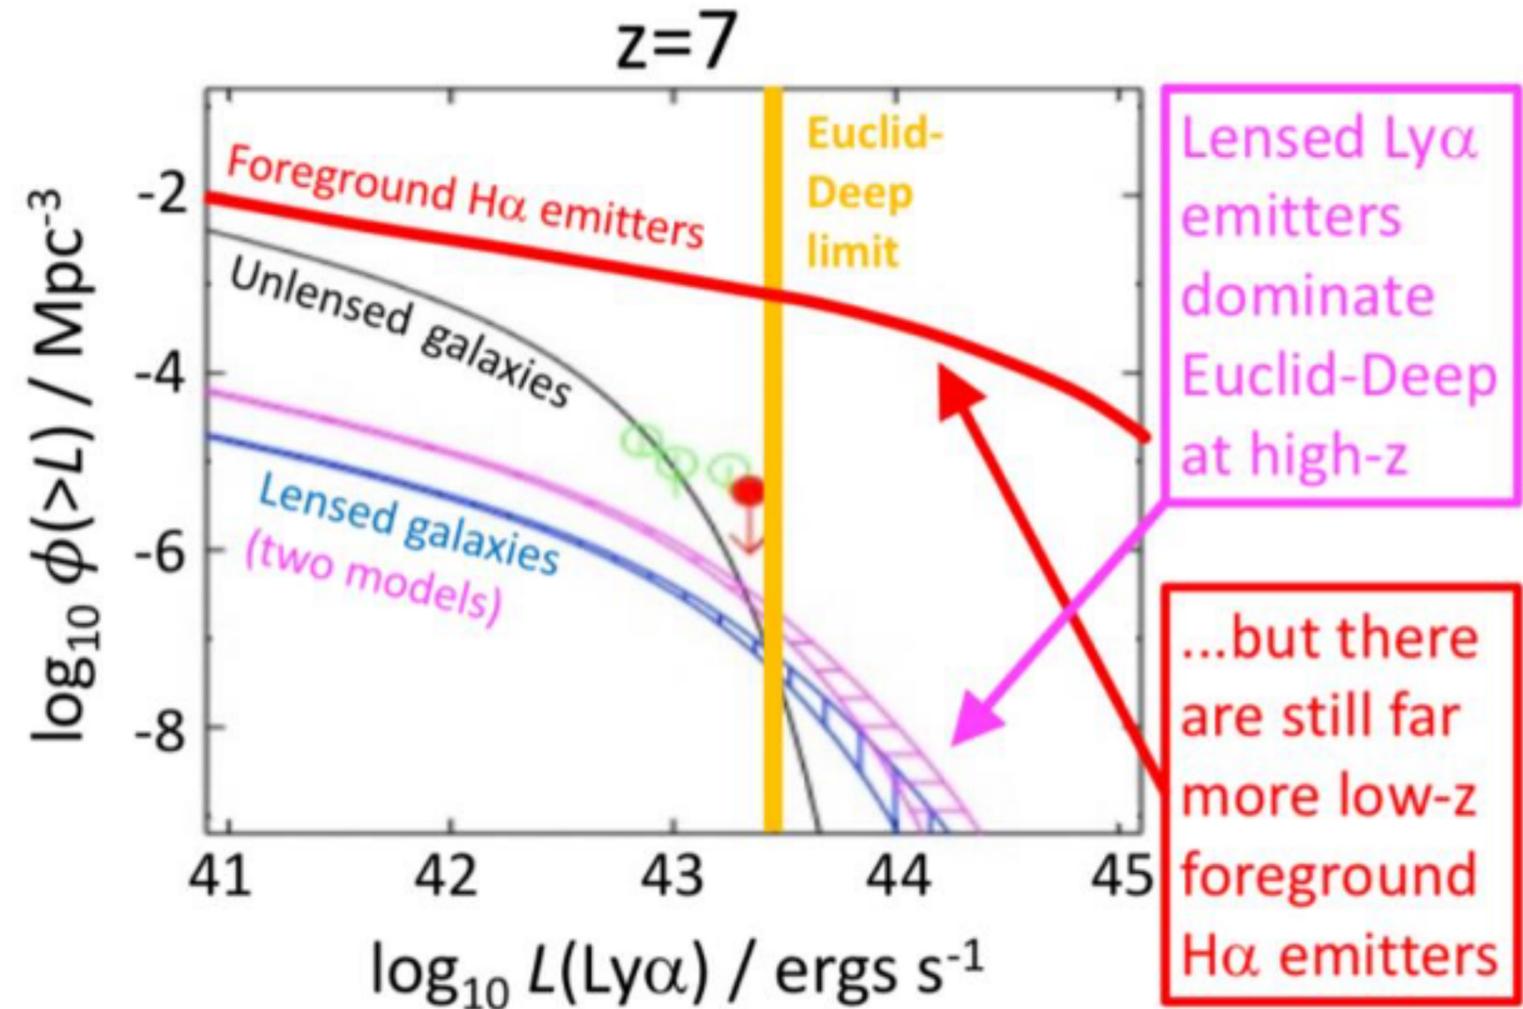

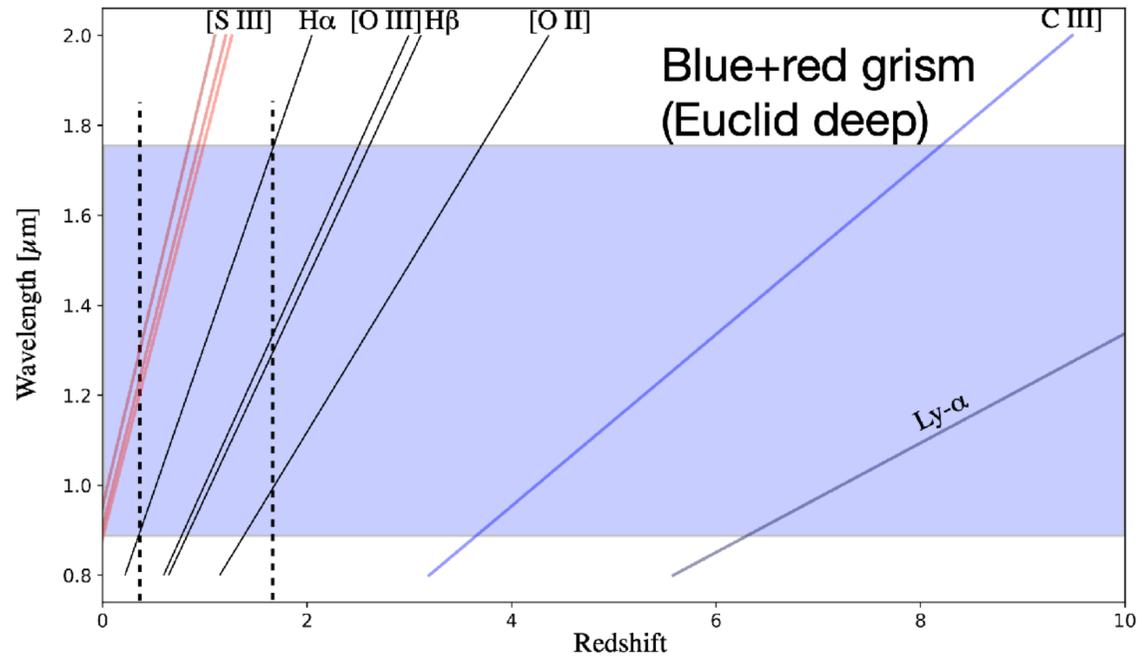

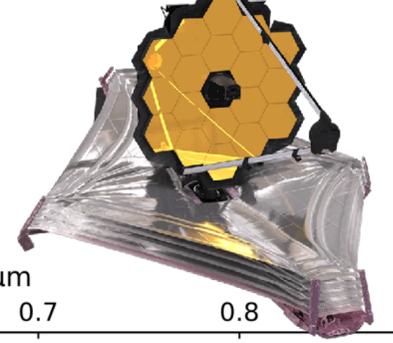

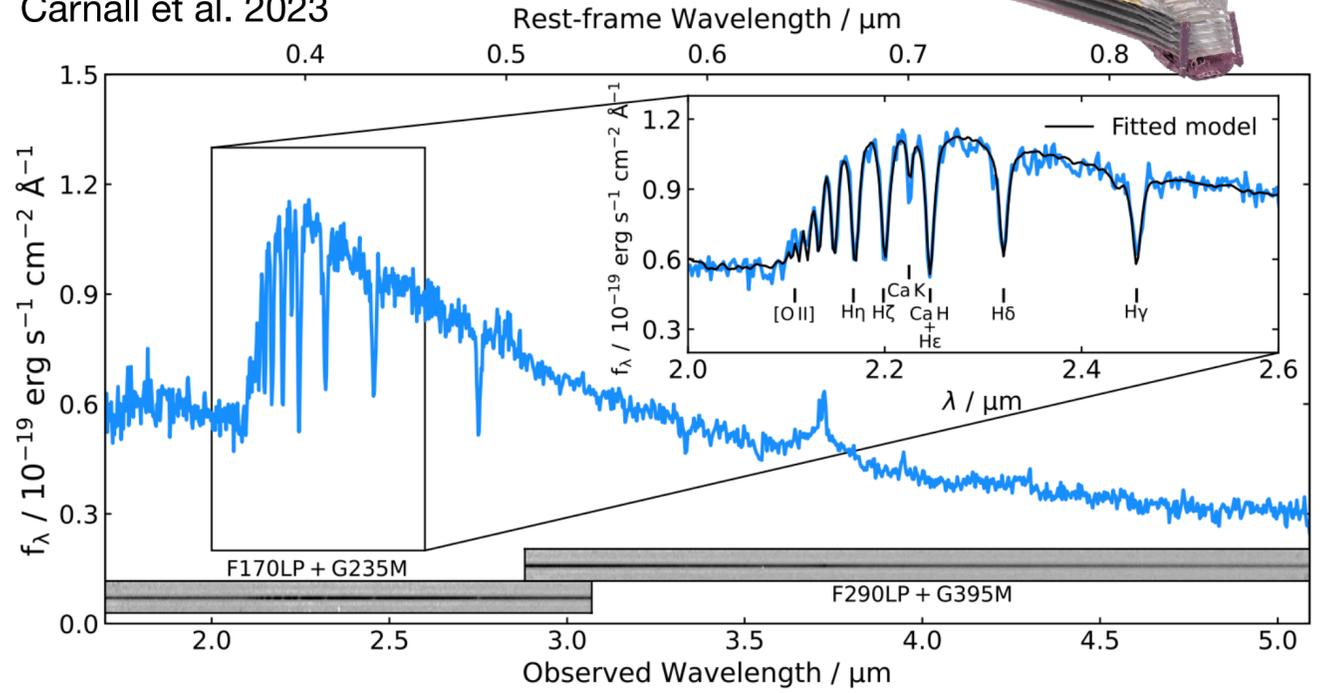

Figure from Marchetti et al. 2017 showing the expected number of $z = 7$ lensed galaxies in the Euclid deep field grism data, in comparison to low-redshift galaxy contaminants

* Pearson et al. 23 (arXiv:2309.00888)

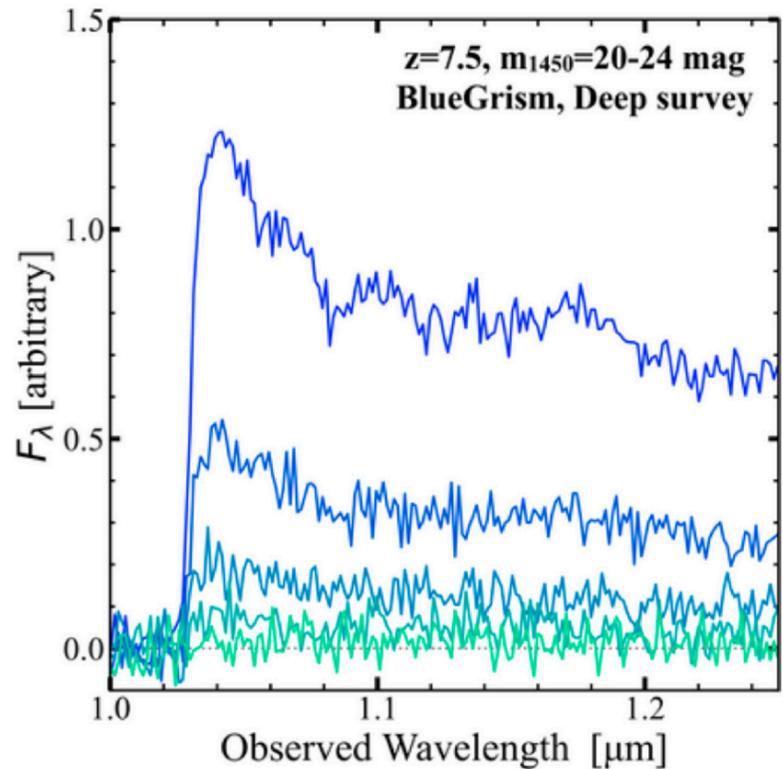

Spectroscopic follow-up will be crucial

Carnall et al. 2023

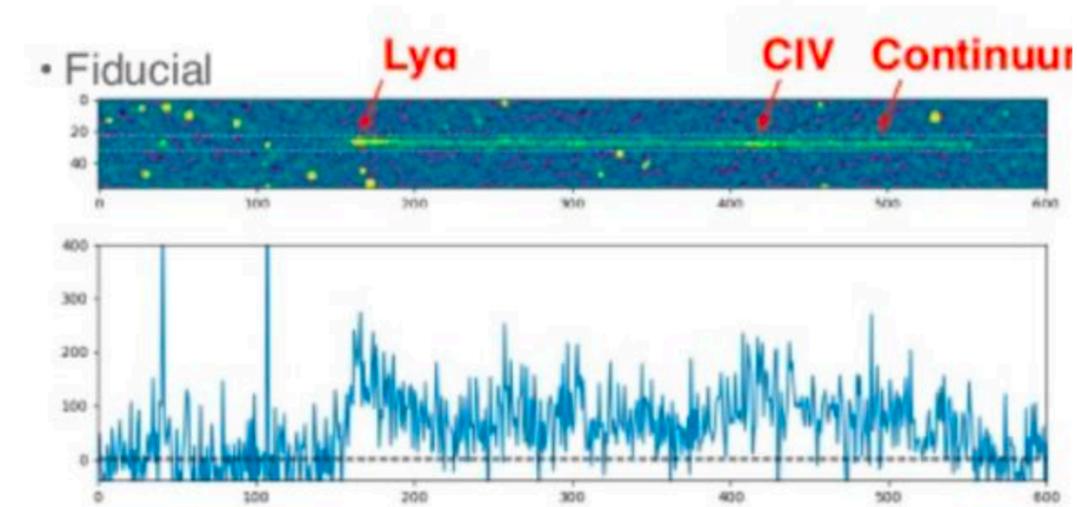

Credits E. Banados. M. Onoue

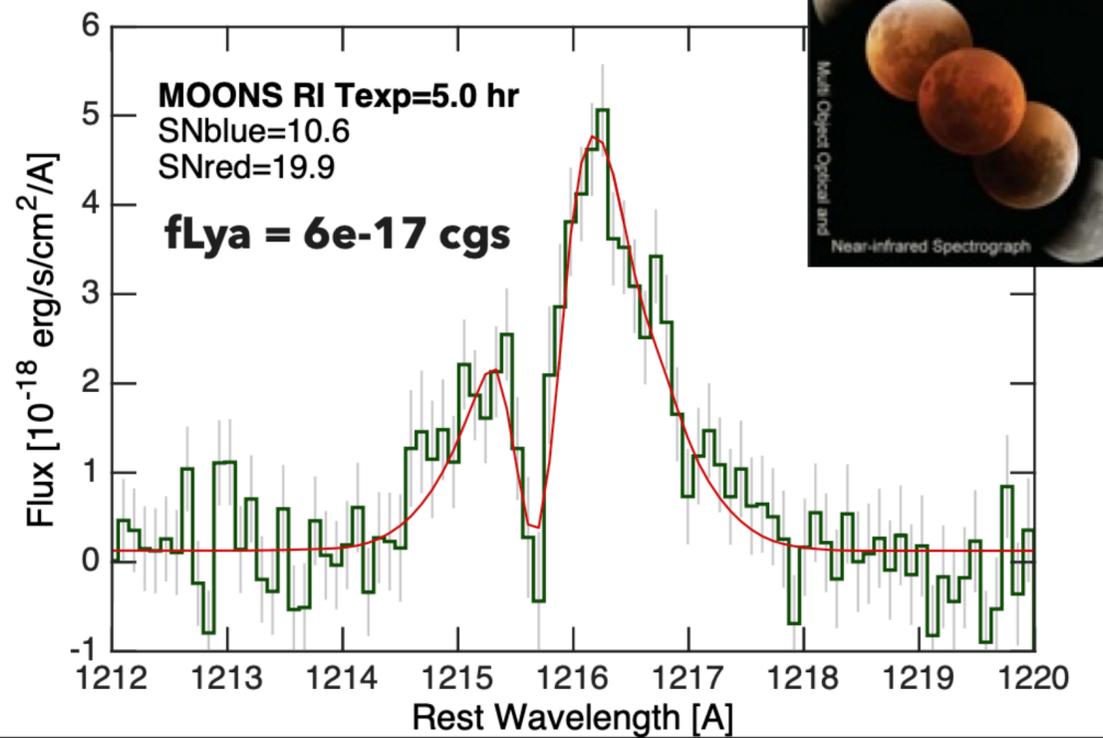

◆ z=10, m1450=20

Red grism (WIDE survey)

Credits P. Oesch

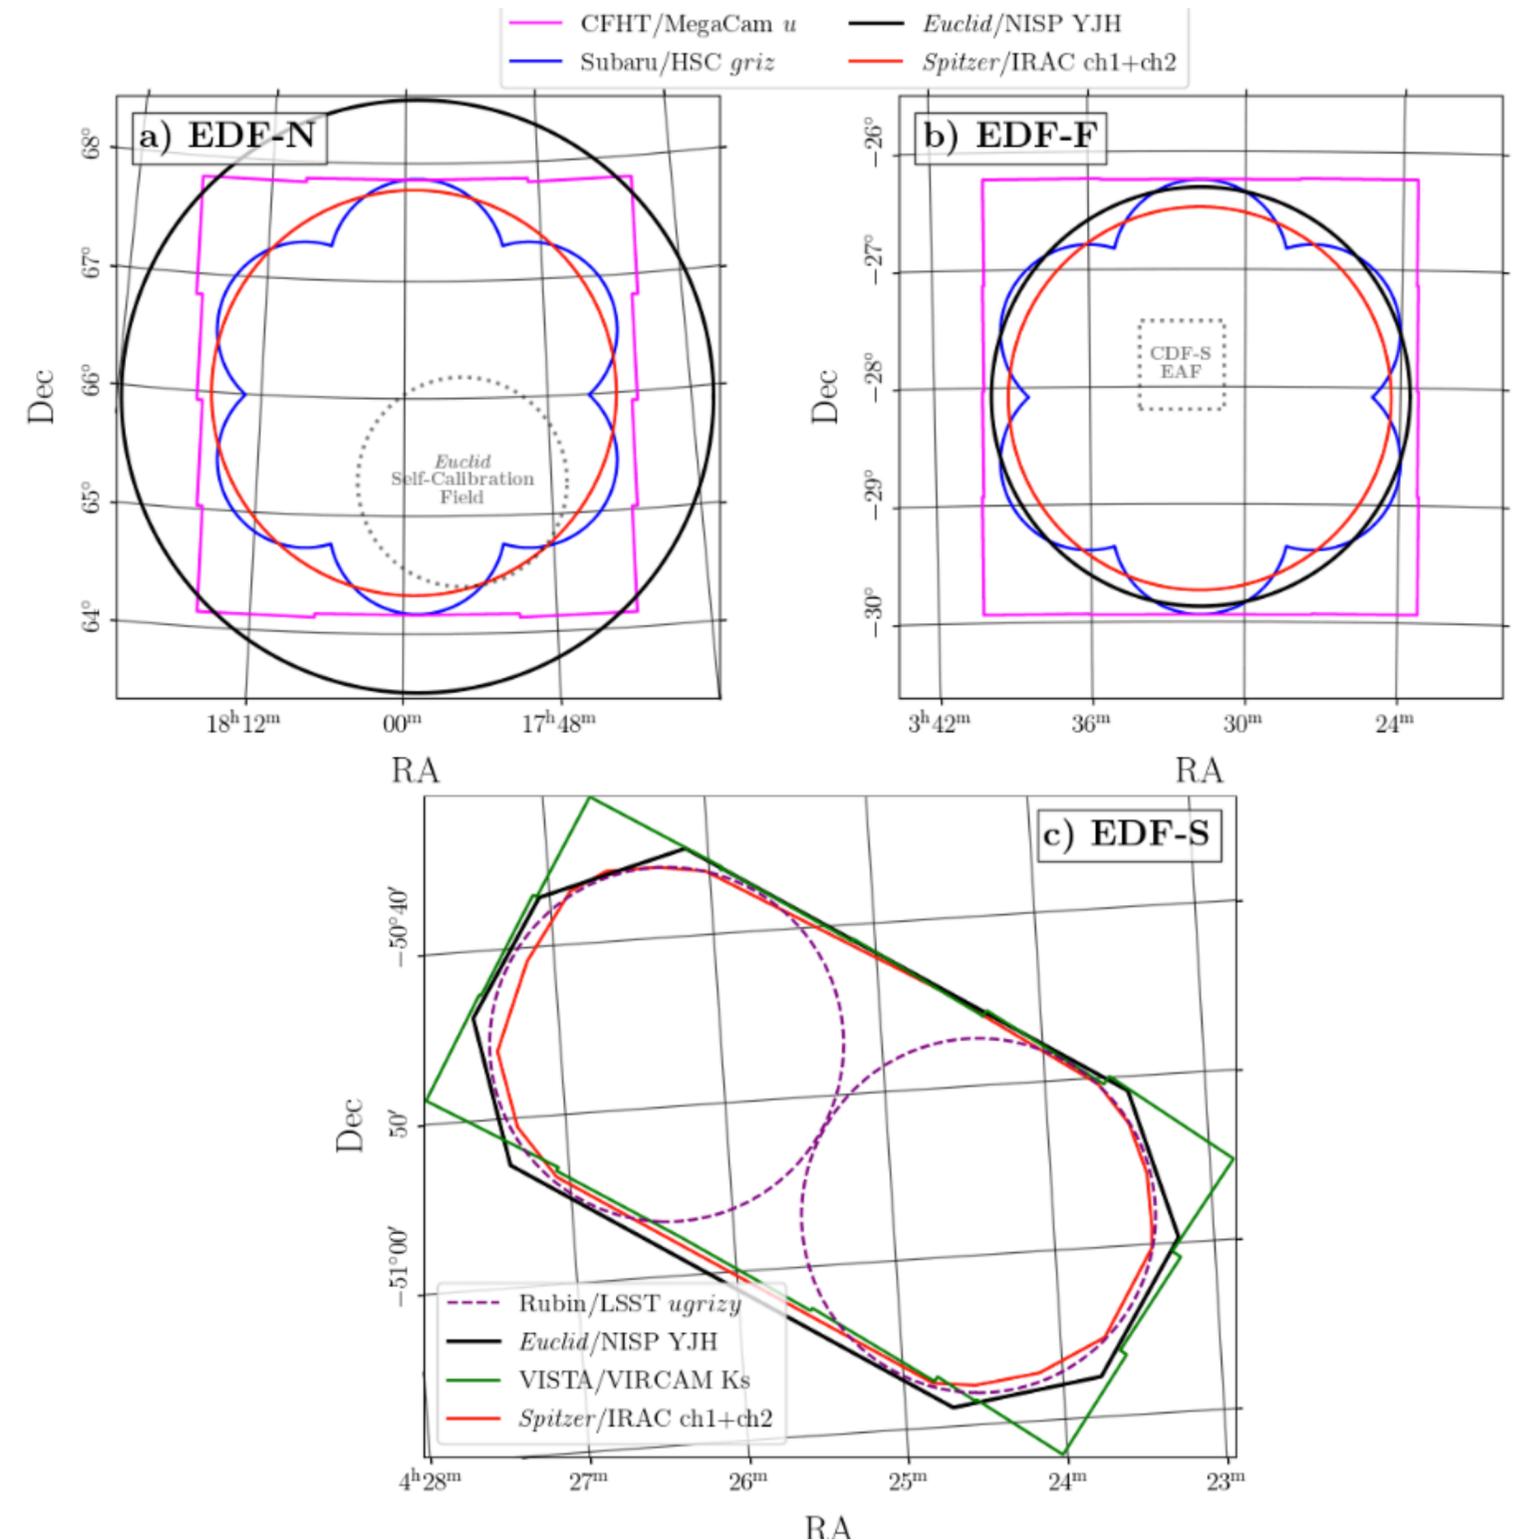

Cosmic DAWN Survey

- A unified value added catalog over $\sim 50 \text{ deg}^2$ in EDFs and EAFs
- Includes CFHT MegaCam, Subaru HSC, Rubin, Spitzer IRAC, and *Euclid*
- Consistent model-based photometry using The Farmer
- Follow-up spectroscopy of dropouts and protoclusters

Overlapping auxiliary data in the three Euclid Deep Fields (EC, McPartland et al. circulated)

The Early Release Observations Program

The chosen narrative of the ERO aimed at exploring the cosmos from our direct neighborhood out to the distant Universe, culminating with a plethora of galaxies

- A first glance at free-floating baby Jupiters with Euclid
Program Scientist : Eduardo Martín (Instituto de Astrofísica de Canarias)
- Euclid view of Milky Way globular clusters
Program Scientist : Davide Massari (INAF-OAS Bologna)
- A Euclid showcase of nearby galaxies
Program Scientist : Leslie Hunt (INAF-AO Arcetri, Firenze)
- The Fornax galaxy cluster & Dorado group of galaxies seen with Euclid
Program Scientist : Ariane Lançon (Observatoire de Strasbourg)
- The Perseus cluster of galaxies
Program Scientist : Jean-Charles Cuillandre (CEA Paris-Saclay)
- A Glimpse Into Euclid's Universe Through a Giant Magnifying Lens
Program Scientist : Hakim Atek (Institut d'Astrophysique de Paris)

Color-Color selection + Compactness

Weaver et al. 2024
