

B) One ^{generic} patch at low β

tilted, separated
not uniform, photometry
from ground?

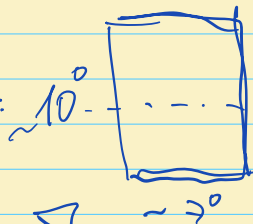

C) Pointed patches:

- high β :

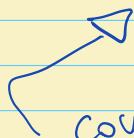

the steeper in β the deeper
(cluster of δ ? interesting
deep field? local galaxies?)

- low β :

at $\beta \sim 0$

could cover some interesting
astronomical field

even galactic fields (!!) TBD (Gaia, microlensing)

\Rightarrow Problem: planets

Next could be the same pattern
for each PSF waiting time.

Problem: blinding δ & ground photometry
