

The Heart of the Data Center - Designing Scalable and Reliable Networks

Thursday, 12 March 2026 14:15 (2 hours)

A Data Center (DC) network requires a design tailored to accommodate a high density of devices physically distributed across medium-to-large environments.

These devices may need to communicate with other hardware within the same DC, often involving high-volume data throughput.

Consequently, the network must fulfill specific requirements, which we will analyze, to achieve a scalable, reliable, and redundant configuration.
