## The exploration of the diversity of architectures of planetary systems

How the architectures are linked to the environments?

- Radiations and stellar properties (age, mass, metallicity, activity,...)
- Environment (presence of additional planets, crowded environments)

Explored both by **searching for new planets** and better **characterization of known systems**

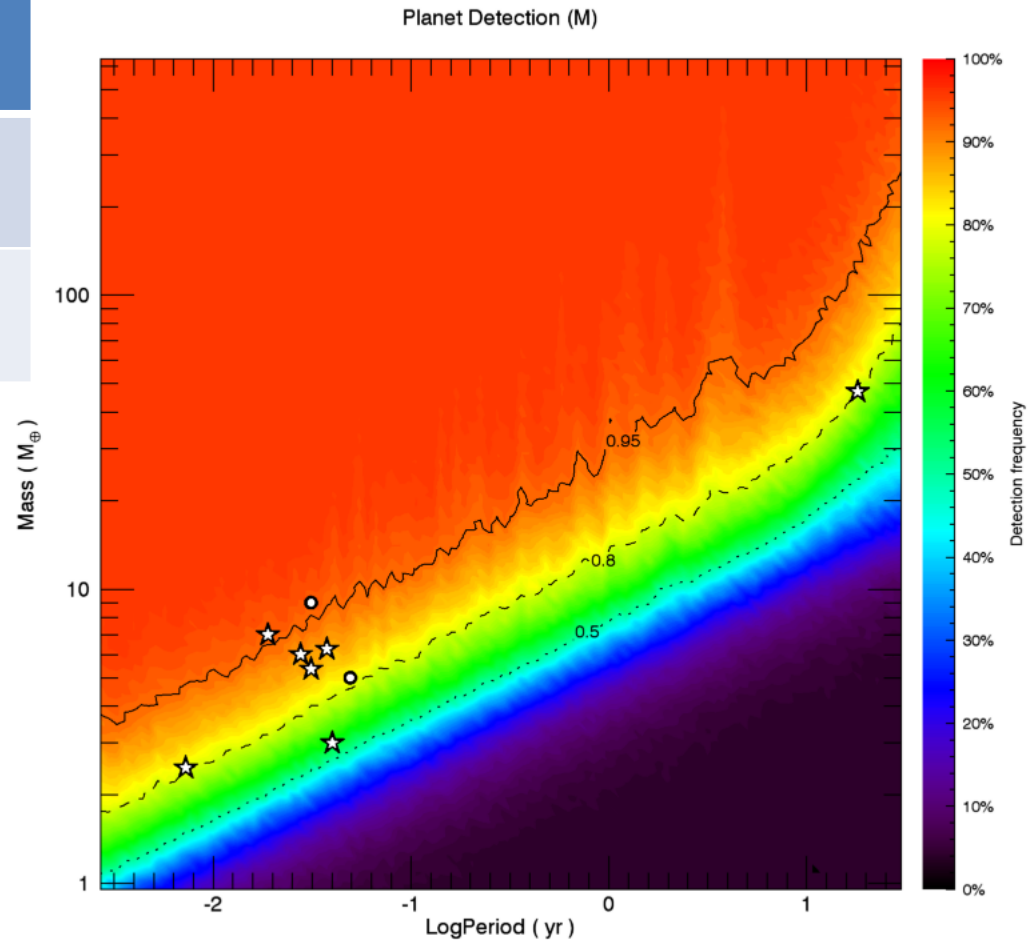

# GAPS Scientific questions

- ❑ Frequency and properties of exoplanets around early M dwarfs
- ❑ Frequency and properties of exoplanets around metal poor stars
- ❑ Impact of open-cluster environment on frequency and architectures of planetary systems
- ❑ Impact of the presence of giant planets in wide orbits on the presence of low mass planets in close orbits (scaled Solar System-like)
- ❑ How frequently are hot Jupiters accompanied by planets in wide orbits
- ❑ Spin-orbit alignment in planetary systems
- ❑ How tides shape the orbital properties of hot Jupiters and how they interact with their host stars

- ❑ The role of scheduling
- ❑ The role of activity even in the quietest stars (see A. Ghedina talk on solar telescope)
- ❑ Typically high multiplicity of low mass planets in close orbits
  
- ❑ Gaussian process and RV challenge: applying the traditional expertise of our community on stellar activity to planet detection
- ❑ Need of dense sampling and large number of measurements when activity modeling is needed (>100 in many cases)
- ❑ Joint scheduling with HARPS-N GTO implemented since AOT34 for better monitoring of the hottest targets

Planet frequency	M	Field G dwarfs
P<50d M<30 M <sub>E</sub>	20.0 <sup>+9.1</sup> <sub>-5.3</sub>	38.8±7.1
P<100d M<30 M <sub>E</sub>	20.0 <sup>+9.1</sup> <sub>-5.3</sub>	47.9±8.5

- ❑ Super-Earths moderately frequent around early M dwarfs
- ❑ Predominance of short periods and multiple systems

# GAPS Planet detections: GJ 3998 b & c

Super Earths system  
around an M dwarf  
**Affer et al. 2016**

**HADES** (HArps-n red Dwarf  
Exoplanet Survey):  
**GAPS + ICE + IAC**

- P = 30.7 d: rotational period of the star
- P = 42.5 d: modulation of the stellar variability due to differential rotation
- P = 2.6 d: orbital period of GJ 3998b
- P = 13.7 d: orbital period of GJ 3998c

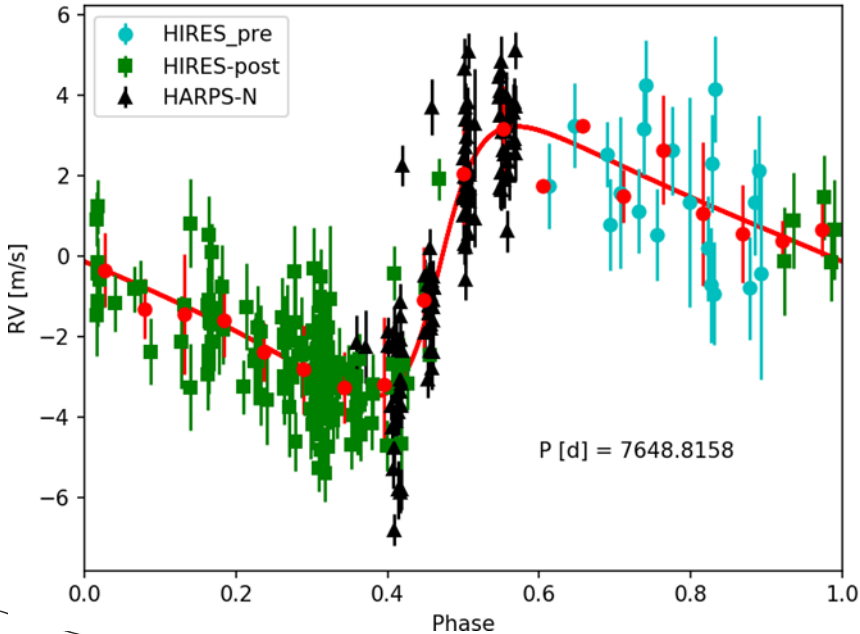

$M_{\text{JIT}} \sim 2.5 M_{\text{Earth}}$   
P = 2.6 d  
e = 0  
K = 1.8 m/s

$M_{\text{JIT}} \sim 6 M_{\text{Earth}}$   
P = 13.7d  
e = 0.06  
K = 2.7 m/s

## Composite planetary system in the binary GJ 15

- Eccentric neptune-size planet around M-dwarf;
- Inner planet orbit refined;
- Planet-star orbital interactions (Kozai effect?)

Folded O-C (RV-Gaussian process noise model minus first planet)

Folded O-C (RV-Gaussian process noise model minus second planet)

	GJ 15A b	GJ 15A c	GJ 15B
Period	11.4 d	21 yr	1300 yr
Mass	3.2 $M_E$	45 $M_E$	0.3 $M_{sun}$
a (AU)	0.07	5.7	150
e	0.0	0.51	0.6

# New low mass planets around M dwarfs

	GJ 3492 b	GJ 625b
Period	6.9 d	14.6 d
Mass	$7 M_E$	$3 M_E$
e	0.0	0.18

Perger et al., in preparation  
 Suarez et al. in preparation

Planet frequency	Metal poor stars	Field G dwarfs
P<50d M<30 $M_E$	<8.4	38.8±7.1
P<100d M<30 $M_E$	16.6 $^{+15.4}_{-8.2}$	47.9±8.5

- ❑ Negative impact of metallicity extends to low-mass planets
- ❑ Lack of short-period planets and similar frequency of warm Neptunes
- ❑ Evidence of metallicity dependence of orbital migration?

# Long period giant planets around metal-poor stars

## Two Long-Period Giant Planets

- Both in the high-[Fe/H] tail of the sample;
- MP31: combined HIRES/HARPS-N solution;
- MP3: the lowest-mass giant

$P = 1640.0053 \text{ d}$ ,  $M_p \sin(i) = 62 M_E$

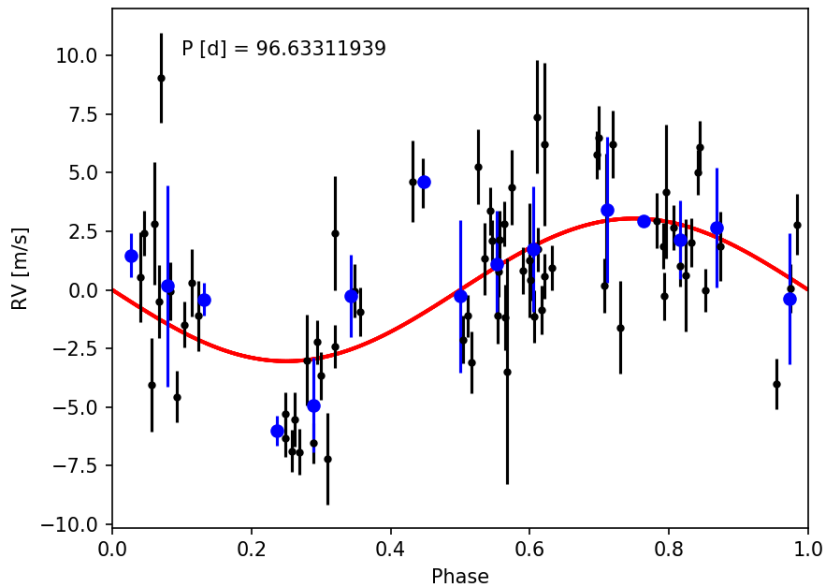

$P = 2085.6873 \text{ d}$ ,  $M_p \sin(i) = 543 M_E$

System	MP3	MP31
Period	1640 d	2086 d
$M \sin i$	$62 M_E$	$543 M_E$
$M_{\text{star}}$	$0.83 M_{\text{sun}}$	$0.73 M_{\text{sun}}$
[Fe/H]	-0.65	-0.74

System	MP4	MP12
Period	96.6 d	58.1 d
M <sub>sini</sub>	14 M <sub>E</sub>	10 M <sub>E</sub>
M <sub>star</sub>	0.89 M <sub>sun</sub>	0.54 M <sub>sun</sub>
[Fe/H]	-0.66	-1.73

### Two intermediate-period Neptunes

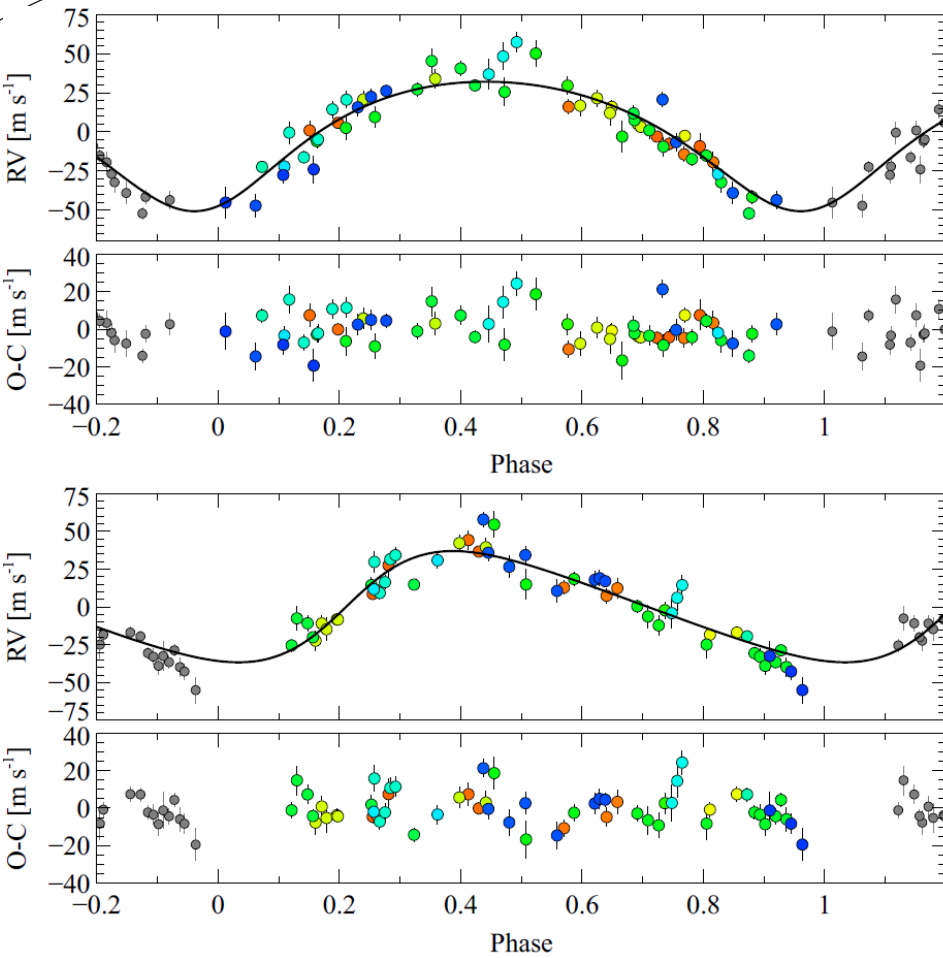

- The lowest [Fe/H] Neptune-type planets;
- RV amplitudes of 2 m/s
- MP4: earliest type primary with [Fe/H] < -0.5
- MP12: 163 HIRES/HARPS-N data;
- MP12: a halo sub-dwarf!

70 HARPS-N + 36 TRES observations of the known Hot Jupiter around Pr 0211 (Quinn et al. 2012), additional photometric observations (STELLA)

Parameter	Pr0211b	Pr0211c	unit
P	$2.14609 \pm 2 \cdot 10^{-5}$	$4364^{+3237}_{-1327}$	days
K	$309.7 \pm 2.5$	$136 \pm 4$	$\text{m s}^{-1}$
$\phi$	$153.0 \pm 0.4$	$259 \pm 4$	deg
$\sqrt{e} \sin \omega$	$-0.03 \pm 0.06$	$0.79 \pm 0.07$	
$\sqrt{e} \cos \omega$	$0.12^{+0.04}_{-0.06}$	$-0.17 \pm 0.08$	
e	$0.019 \pm 0.009$	$0.65 \pm 0.11$	
$\omega$	$344 \pm 28$	$103 \pm 6$	deg
$M_p \sin i$	$1.91 \pm 0.02$	$8.1 \pm 0.2$	$M_{\text{jup}}$
a	$0.03210 \pm 0.00009$	$5.2^{+2.3}_{-1.1}$	AU

- HJ in nearly circular orbit
- Long period Jupiter in high eccentricity orbit
- Architecture possible signature of dynamical interactions in star cluster
- Activity in this target stronger with respect to other M44 targets

	OC 107b	OC 116b	OC 116c
P	78.3 d	42.0 d	113.9d
Mass	0.47 M <sub>J</sub>	0.64 M <sub>J</sub>	0.78 M <sub>J</sub>
e	<0.24	<0.28	<0.30
Prot	9.1	9.4	

- Detections made possible by modeling of stellar activity

Planet frequency	Stars with planets	Field G dwarfs
P<50d M<30 M <sub>E</sub>	5.9 <sup>+11.2</sup> <sub>-1.9</sub>	38.8±7.1
P<100d M<30 M <sub>E</sub>	11.7 <sup>+12.1</sup> <sub>-4.0</sub>	47.9±8.5

**Significant deficit of low-mass planets (Neptunes and super-Earths) around stars with long-period giant planets (particularly at short periods)**

# Disentangle the planetary and activity signals: HD 164922

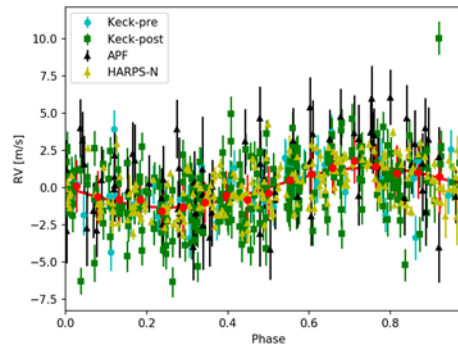

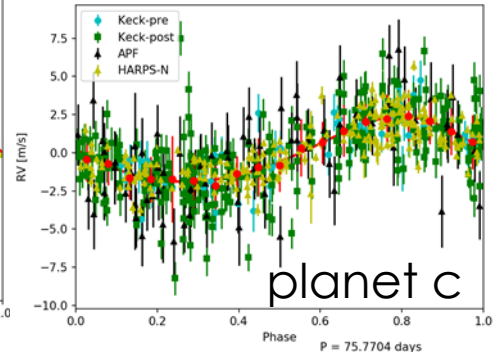

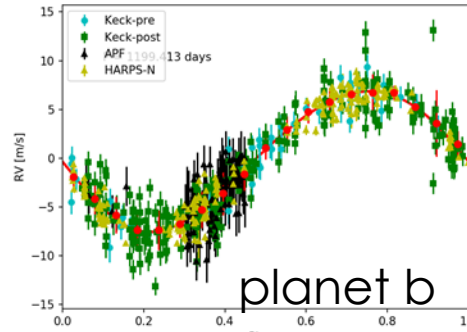

Butler et al 2006: HD 164922 b

## HARPS-N

- **Season 1, S2:** periodicity at 20 d (now identified as the 1<sup>st</sup> harmonic of  $P_{rot}$ ) + 12.46 d
- **End of S3:** first evidence of the period found in the Keck residuals (~76 d)

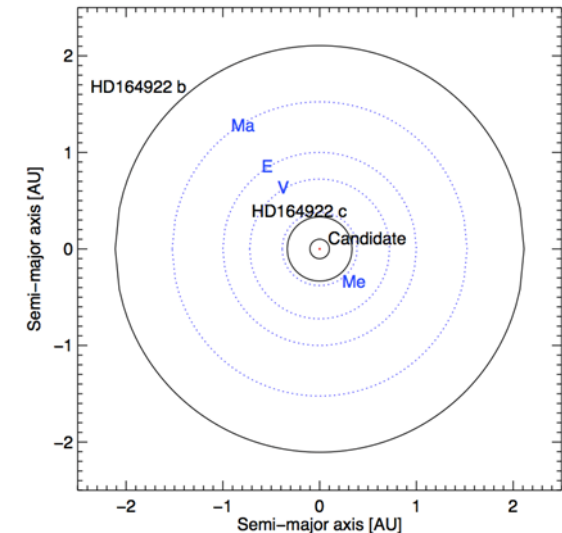

Fulton et al. 2016:

HD 164922 c confirmed with ~400 RV data

Suitable target for CHEOPS

Gaussian Processes seem to support the presence of planet d

	Planet b	Planet c	Candidate
Period [days]	$1199.4 \pm 5$	$75.77 \pm 0.05$	$12.459 \pm 0.002$
$M_{\text{sin } i} [M_{\text{Earth}}]$	$109 \pm 5$	$13 \pm 1$	$4.4 \pm 0.5$
Semi-amplitude [m/s]	$7.2 \pm 0.3$	$2.1 \pm 0.2$	$1.3 \pm 0.1$

Homogenous analysis of **231 transiting giant planets** (45 observed within GAPS) through a dedicated Bayesian DE-MCMC tool:

- The largest uniform catalog of giant planet orbital and physical parameters
- Significant refinement of the orbital solution for some target (eccentricity)
- Monitoring of RV long-term trends (to find additional distant companions)
- Goal: understand the migration of short-period giant planets

The distribution of  $a/a_R$  (semi-major axis VS Roche limit) points toward a **high-eccentricity migration** scenario, but it is not exclusive (a few evidence of disk migration)

Planets with  $e \geq 0.1$  can be the result of migration from highly eccentric orbits (planet-planet scattering, Kozai-Lidov perturbations, or secular chaos)

**Tidal diagram:** orbital parameters are shaped by tides

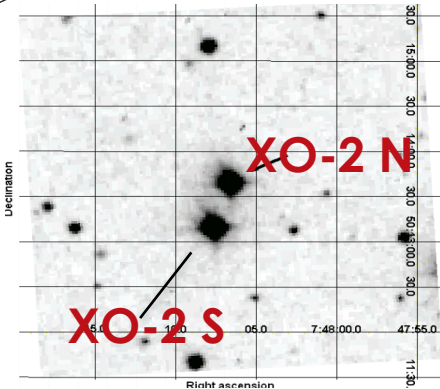

# Planet detections: XO-2 S b & c

Burke et al. 2007: Hot Jupiter transiting XO-2 N

Desidera et al. 2014: 2 planets around XO-2S

**First case of binary system on which both components host planets**

	XO-2 Sb	XO-2 Sc
P [d]	18.157	120.80
$m \sin i$ [ $M_J$ ]	0.259	1.370
e	0.180	0.153

Laboratory for planet formation process:

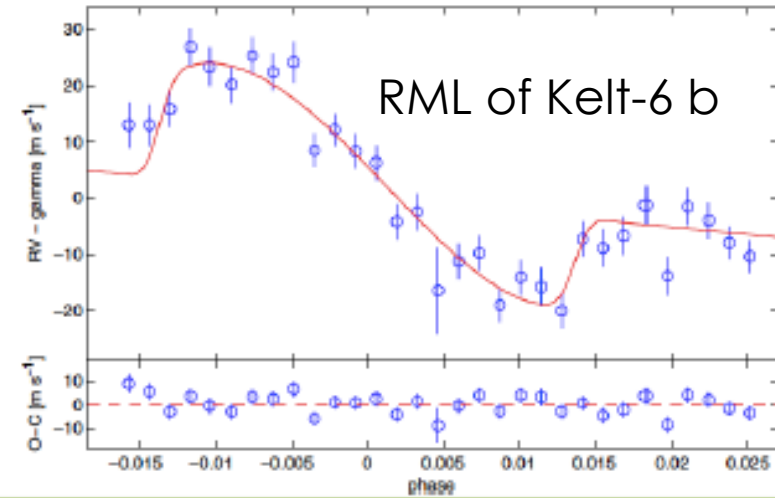

Abundance difference between the components correlated with condensation temperature

*Desidera et al. 14, Damasso et al 15, Biazzo et al. 15*

# Long-period companions around stars with Hot Jupiters: Kelt-6 c

Kelt-6 b, Saturn-mass planet orbiting a late-F star (Collins et al. 2014)

	Kelt-6 b	Kelt-6 c
Period	7.8 d	1276 ± 74 d
Mass	0.44 M <sub>J</sub>	3.7 M <sub>J</sub>
e	0.03	0.2
λ	-36 ± 11	-

**Damasso et al. 2015b**

Several additional long-period trends identified

# System spin-orbit alignment through Rossiter effect

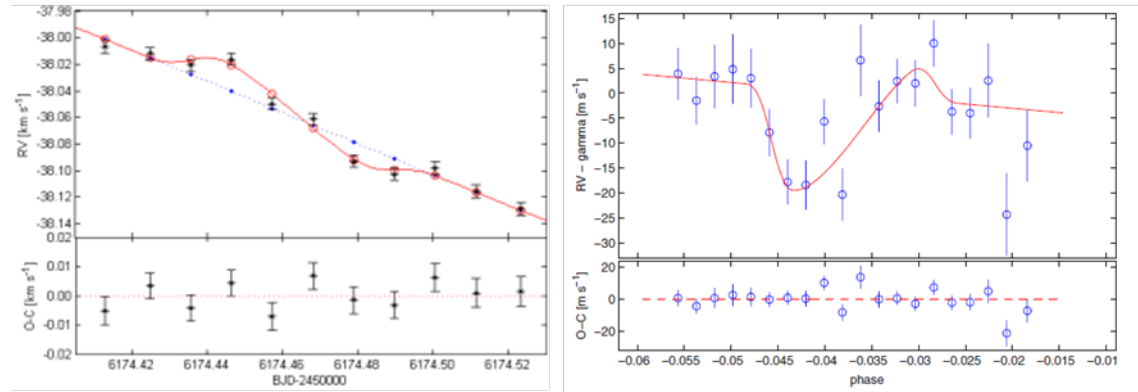

Focus on late-type stars, previously quite under-represented in the literature

Most systems aligned but some cases highly misaligned

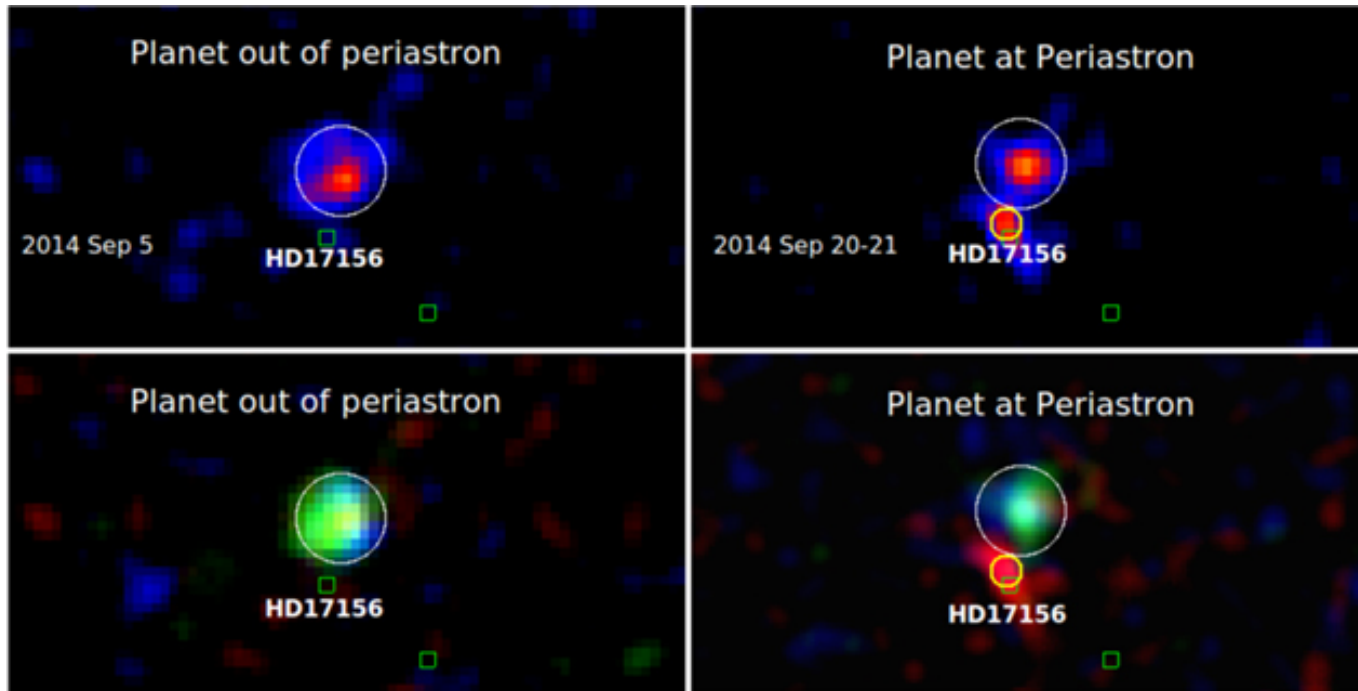

Important role of stellar tides

Some 3D alignment determinations when including photometric rotation periods

**Covino et al. 2013;**  
**Esposito et al. 2014; 2017**  
**Mancini et al. 2016**

# Star-planet interaction in a highly eccentric planetary system

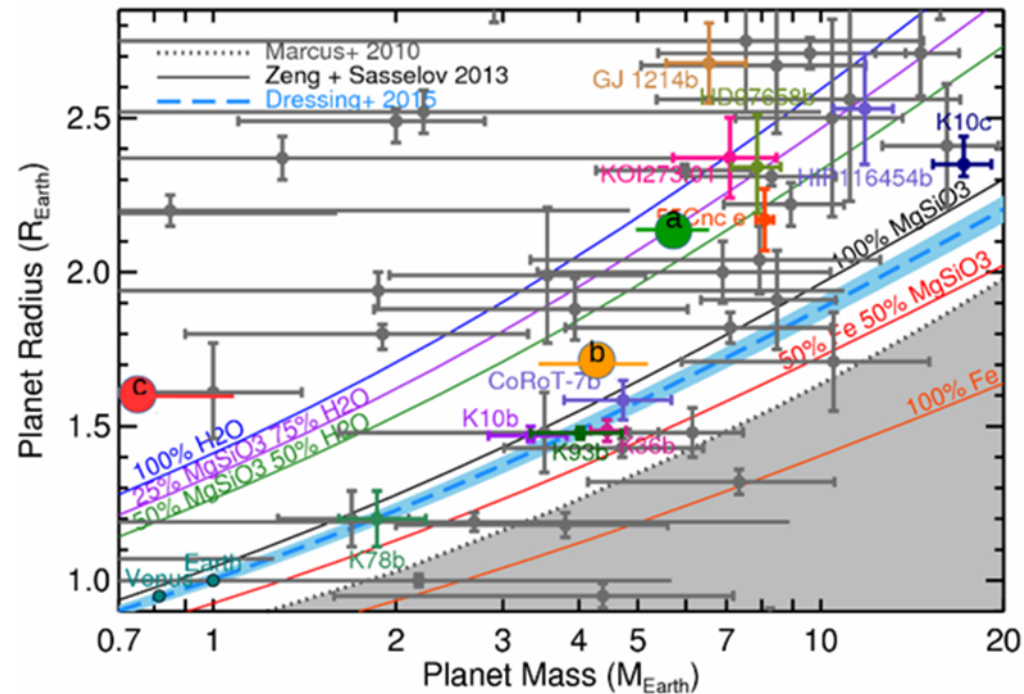

Strong increase in X-ray luminosity and chromospheric emission close to periastron passage of the planet around HD 17156 in a highly eccentric orbit

# Planet detections: TYC 4282

Planet around a thick disk giant star

Validation of GIARPS concept through quasi-simultaneous HARPS and GIANO observations

- ❑ Planetary system with 3 transiting planets discovered by K2 (one in the habitable zone).
- ❑ Characterization only feasible with intensive joint campaign with HARPS-N (GAPS + GTO) and HARPS. 290 spectra overall

- ❑ Planet rejection: ***Desidera et al. 2013***
- ❑ Major refinements for Tres-4: ***Sozzetti et al. 2015***
- ❑ Asteroseismology and SPI for  $\tau$  Boo: ***Borsa et al. 2015***
- ❑ Characterization of HD 108874: ***Benatti et al. 2016***
  
- ❑ Stellar parameters of early-M dwarfs ***Maldonado et al. 2015***
- ❑ M dwarfs activity characterization: ***Maldonado et al. 2016;***  
***Scandariato et al. 2016***
- ❑ M dwarf survey simulations: ***Perger et al. 2016***

- Observations focused on the confirmation of best candidates
- Joint scheduling with GTO allows to distribute the observing time on 2x nights,
- Intensive sampling mandatory for disentangling low-amplitude activity and Keplerian signals (see Pale Blue Dot Campaign on Proxima)

# Summary of planet detections

Planet	Period	e	M <sub>sin</sub> i	Remarks
XO-2Sb	18.1d	0.18	0.26 M <sub>Jup</sub>	<b>First binary system with both components hosting planets</b>

**All new low mass planets detected by GAPS suitable target for CHEOPS space missions**

# GAPS Scientific questions

- ❑ Frequency and properties of exoplanets around early M dwarfs
- ❑ Frequency and properties of exoplanets around metal poor stars
- ❑ Impact of open-cluster environment on frequency and architectures of planetary systems
- ❑ Impact of the presence of giant planets in wide orbits on the presence of low mass planets in close orbits (scaled Solar System-like)
- ❑ How frequently are hot Jupiters accompanied by planets in wide orbits
- ❑ Spin-orbit alignment in planetary systems
- ❑ How tides shape the orbital properties of hot Jupiters and how they interact with their host stars

- ❑ Moderately frequent super-Earth planets at small separation around early *M* dwarfs. Often multiple systems
- ❑ Lack of hot Neptunes and Super-Earths around metal-poor stars, frequency of warm neptunes similar to solar-type stars
- ❑ Evidence for impact of metallicity on orbital migration?
- ❑ No paucity of planets in open clusters
- ❑ Possible signatures of dynamical interactions in the architectures
- ❑ Negative impact of the presence of outer giant planets on inner low-mass planets
- ❑ Decisive role of tides in shaping the properties of close-in planets revealed by eccentricity +spin-orbit determination
- ❑ Erratic nature of SPI, role of planet eccentricity?

# GAPS Conclusions

- ❑ GAPS definitely successful program, several very interesting results
- ❑ **Benchmark planet detections**, such as first binary system with both components hosting planets, first planetary system in a cluster, a warm neptune around a very metal poor halo star
- ❑ **Relevant results from preliminary statistical analysis**, some completely new (paucity of low-mass close-in planets in stars with long-period giant planets, abundance of warm neptunes around metal-poor stars)
- ❑ Revealed **great diversity of planetary system in different environments**
- ❑ Next step: looking at the **origin** of such a diversity using **GIARPS**. See A. Bonomo talk
