The WINGS VST survey

Wednesday 6 June 2018 16:35 (20 minutes)

I summarize the results achieved with the analysis of the data of the OmegaWINGS survey at VST in the u,B,V bands concerning in particular the global structure and the scaling relations of galaxy clusters. I will provide solid evidences in favor of: 1) the non-omology of the growth curve light profiles and 2) the existence of a color-magnitude relation for galaxy clusters.
