

Disc Orbital Precession Around Eccentric Binaries: Application to the GG Tau A System

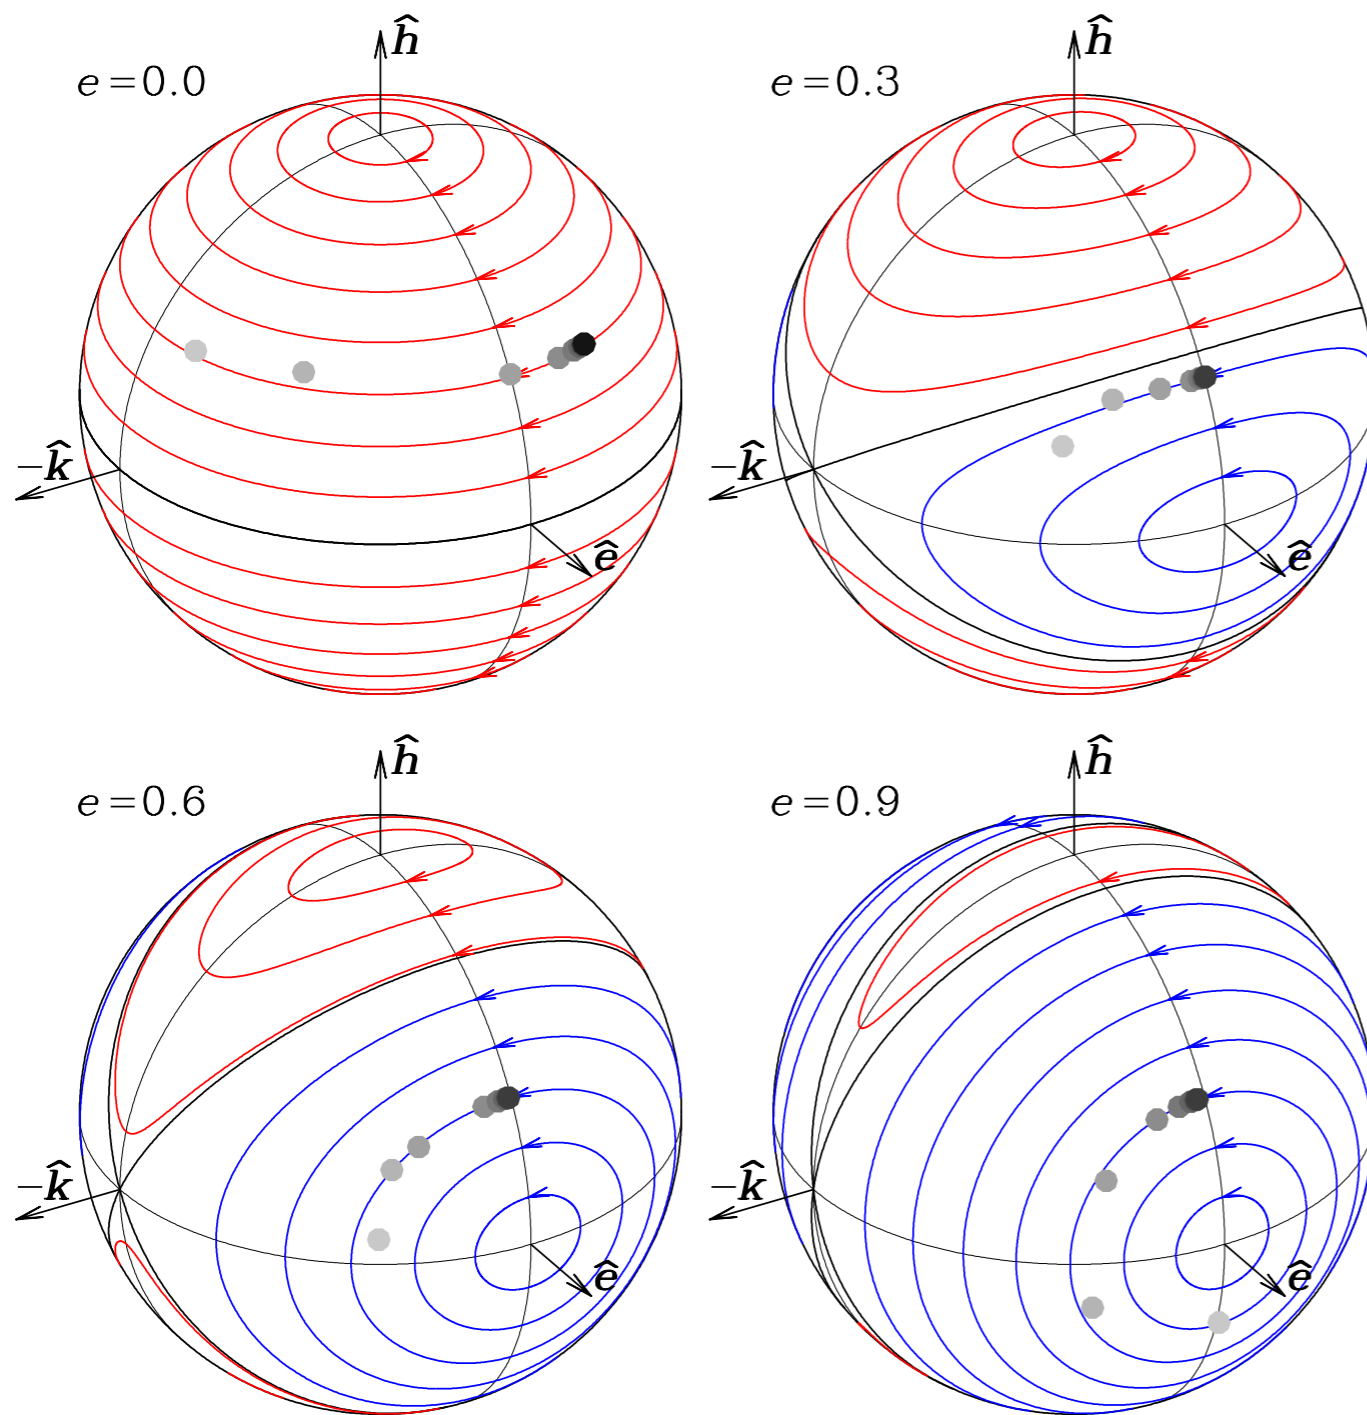

Hossam Aly

Aly H., Lodato G., Cazzoletti P., MNRAS, submitted

Background: GG Tau

- Quadruple system $\sim 140\text{pc}$
- Dust ring observed around GG Tau A at radius $\sim 235\text{AU}$
(Andrews et al 2014)
- Fits to proper motion constrain disc inclination and SMA:
Co-planar \longrightarrow SMA = 34AU
Inclined ($\sim 25^\circ$) \longrightarrow SMA = 60AU
(Köhler 2011)
- Co-planar: Density peak at $\sim 150\text{AU}$ (Cazzoletti et al 2017)

Eccentric Binaries: Precession

Eccentric Binaries: Disc Tearing

$e=0$

$e=0.3$

$e=0.6$

$e=0.9$

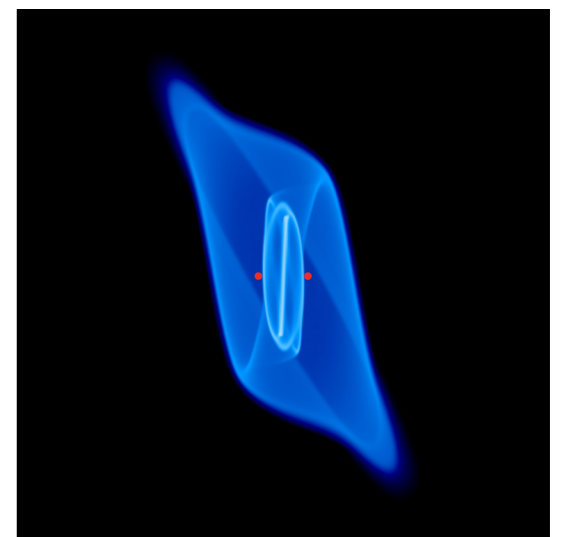

$\theta=30$

$\theta=45$

$\theta=60$

Simulations Setup

- Performed 12 simulations varying the disc mass and inclination ($M_d=0.1, 0.01, 0.001$; $i^\circ= 15, 30, 45, 60$)

- Disc parameters:
 $H/R=0.12$
 $\text{Alpha}=0.01$

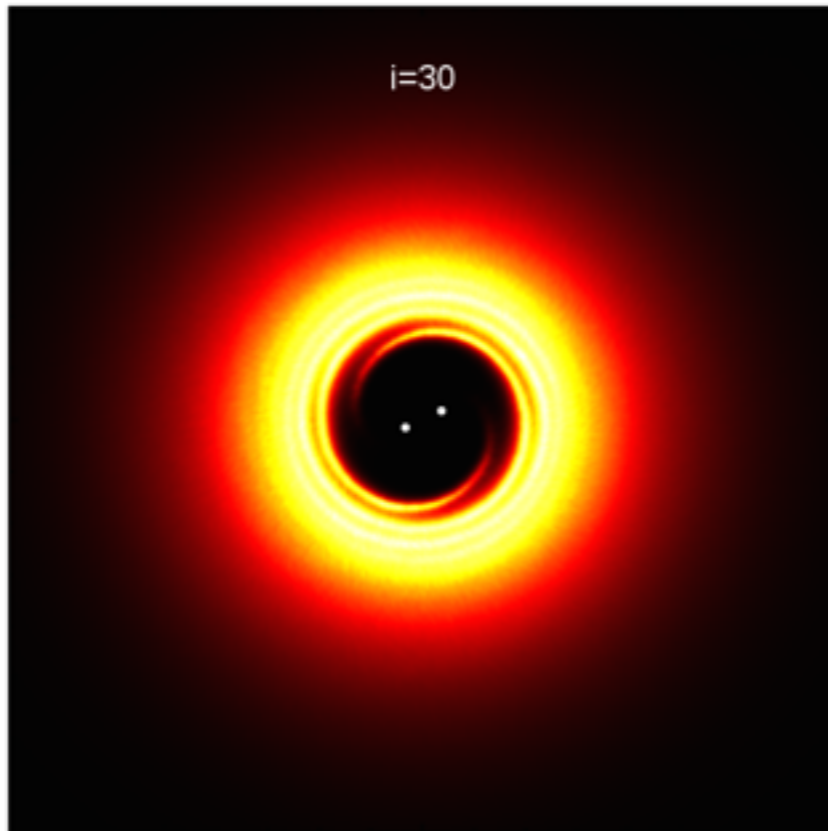

- Binary parameters:
 $e=0.45$ $a=60\text{AU}$
