II National Workshop of SKA Science and Technology

Bologna, Italy - Dec. 3\textsuperscript{rd}, 2018
Overview

• Introduction to Phased Array Feed (PAF)
• SKA Advanced Instrumentation Programme on PAFs
• Science motivations
• The original PHAROS programme
• The PHAROS2 upgrade plan
• Future testing
Introduction to Phased Array Feeds

Imaging with a single antenna equipped with an array:

- Off-axis rays are focused to off-axis points in the focal plane.
- Placing an array of feeds in the focal plane increases the survey speed of a radiotelescope by a factor of $N$ (with respect to SPF), with $N$ number of simultaneous primary beams.

**Survey Speed** $\sim N \lambda^2 \text{BW} (D/T_{\text{SYS}})^2$

- $\text{BW} =$ bandwidth
- $T_{\text{SYS}} =$ system noise temperature

- A Phased Array Feed is made of closely packed antenna elements ($d \sim \lambda/2$) that, by spatially sampling the focal plane, can synthesize multiple independent beams and be set to Nyquist-sample the sky (unlike array of feed-horns that require few interleaved pointings).

- Beam shapes and directions are controlled electronically by weighting the amplitudes and phases of the signals applied to the individual antennas by a beamformer.

Far-field beam $\sim \lambda/D$

$\theta \sim d/f_{\text{eq}}$

$d \sim \lambda/2$

$D$

$f_{\text{eq}}$

$\theta$
Introduction to Phased Array Feeds
Some of the advantages of Phased Array Feeds

- Possibility to achieve complete coverage of the available radio telescope Field of View (FoV) with multiple simultaneous beams, thus increasing the survey speed if compared to a single-pixel feed;
- Improve antenna efficiency over very wide freq. band;
- Reduction of bandpass ripples;
- Correct for off-axis aberrations;
- Compensate for large-scale distortion of dish surface errors;
- Direct one or more beams towards calibrator while observing the astronomy source of interest (reduces total observation time);
- Radio Frequency Interference (RFI) mitigation;
- Improvement of the beams polarization purity;
- Possibility to perform electronic de-rotation of the astronomical field during source tracking.
- Reconfigure the properties of the beams in real time;
- Elaborate observations in post-processing using a post-correlation beam former;
- Possibility to achieve complete coverage of the available radio telescope Field of View (FoV) with multiple simultaneous beams, thus increasing the survey speed if compared to a single-pixel feed;
SKA Advanced Instrumentation Program (AIP): PAF Consortium

- INAF is part of the SKA AIP on PAF;
- The AIP kick-off was held in Cagliari in 2016, following the PAF2016 Workshop organized by INAF;

8 Full Members:

- INAF
- JLR
- CSAO
- ASTRON
- University of Malta

2 Prospective Members:

- CSIRO
- IEEC

It is currently funded by in-kind contributions of the member institutes that are focussed on their own PAF R&D programs – with no real focus on SKA PAFs yet.
Science motivations for C-band PAF

- SKA Band 5 had second highest priority
- C-band continuum surveys and polarization measurement, particularly in the Galactic Plane
- CMB foregrounds
- Gamma Ray Burst and Gravitational Wave event follow-ups
- FRB search
- Flat spectra transients/pulsars, like magnetars
- Excited rotational states of OH near 6.03 GHz
- Zeeman effect, star formation
- CH3OH line (6.7 GHz) survey of methanol masers
- Gas kinematics, UC HII region
- Formaldehyde line emission at 4.8 GHz
- Polarization mapping of Galaxy Clusters and SNRs
- Hydrogen recombination lines around 5 GHz
- Galactic Centre high DM pulsar search
The original PHAROS programme

• Cryogenically cooled PAF
• 4-8 GHz
• Analogue beam forming
Vivaldi antenna array

- 10x11 dual pol. array
- Only central elements active
- Rest matched terminated
PHAROS Analog beamformer

- 13 input Wilkinson combiner
- Phase and Amplitude Controller (PAC module)
- 4 analogue beams formers
Anechoic chamber tests

13 element beam-formed patterns
Steering the beam

Using the array in “aperture array” mode
Window and IR filter

- 15.6 mm thick Plexiglas vacuum window
- IR filter: stacked combination of Styrodur and Eccofoam
System temperature performance
PHAROS2 upgrades

• Prepare for full instrument
  - Improve sensitivity
  - Address scaling issues
• Low noise amplifiers
• Vacuum window
• Digital back-end
• Warm Section downconverter
New cryogenic amplifiers: Low Noise Factory LNAs

PHAROS2 LNA

Excellent performance
How do we afford populating full array?
Multi-channel LNA bias

• Design of analogue and digital boards
• Each analogue board can handle 8 bias channels
• Each digital board can control and monitor 8 analogue boards
• The interface is ASCII command via TCP/IP or RS 232.
Vacuum window

- Simulations show significant degradation due to 15.6 mm Plexiglas

- NRC design using TenCate EX-1515 laminate
  - ~1 mm thickness
  - Simulations very promising

Credit: NRC
Warm Section and Digital backend

- Replace analogue beamformer
- Room temperature multichannel receiver (Warm Section):
  - Downconvert to 375 – 650 MHz IF
  - IQ mixer to extract LSB; additional filters possible
  - Ethernet monitor and control
- IF transmitted over optical fibre:
  - 2 WDM signals per core
  - Developed for SKA LFAA
- iTPM board:
  - 16 dual ADCs and 2 XILINX Ultrascale XCU40 FPGAs
  - Sample at 700MS/s
  - Ethernet out

Standard 6U rack (19”) with: 4 WS RF/IF modules, 1 LO distribution module and 3 power supplies handling 32 x RF input signals, 24 from cryostat + 1 calibration from noise source (7 unused);
Fabricated prototype: PCB & components

- x8 RF inputs
- LO input
- LO filter
- Buffer
- LO amps
- LO LPF
- IF hybrid
- IF amp
- IF filters
- DC connector
- IF output (MCX connector)

Dimensions:
- 160 mm
- 233.4 mm

Fabricated prototype: PCB & components
Prototype of PCB, mech. housing and optical transmitters
Test of WS RF/IF prototype module

The module works well, according to specification.

“Filter a”: 4.775-5.050 GHz, $f_{LO}(b)=5.425$ GHz
“Filter c”: 5.780-6.085 GHz, $f_{LO}(c)=6.430$ GHz
“Filter d”: 6.445-6.720 GHz, $f_{LO}(d)=7.095$ GHz

The production modules were slightly modified in design for performance improvement. Recent tests demonstrated that also the production modules are compliant.
PHAROS2 IFoF WDM optical links
Developed for SKA LFAA by INAF-led collaboration:

Some of the optical transmitters (part of WS modules):

One of the optical receivers (part of the preADU):

2 preADUs, each with eight optical receivers:
PHAROS2 digital backend based on iTTPM (Italian Tile Processing Module, developed for SKA LFAA)

One iTTPM utilizes one ADU (Analog Digital Unit) and two preADUs:

- ADU
- preADU#1
- preADU#2
- Optical pigtail (from back to front panel)
PHAROS2 digital backend based on iTPM

16 x LC/APC optical inputs

Front Panel Size: 6U, 21HP

1Gb Ethernet

ADU heatsink

465mm

PPS input

QSFP+ for 40GbE network

10MHz Input
ADU (Analog Digital Unit)

- Accepts 32 analog inputs, ≈500 MHz BW;
- 16 dual-ADCs AD9680, JESD204B, 1 GS/s ENOB=10.8;
- 2 x FPGAs XILINX Ultrascale XCU40 20 nm;
- 2 x DDR3 96 bit memory banks, 6+6 Gbit total size;
- Digitisation at 700MS/s → the 375-650 MHz IF band is sampled in second Nyquist zone; in PHAROS2 the signals are reversed twice (LSB tuning and second Nyquist results in non-reversed passbands);
- 2 x 40Gbps Ethernet interfaces (QSFP), one for each FPGA;
- High speed internal bus to connect the 2 FPGAs, 25 Gbps + 25 Gbps bidirectional;
- Power consumption ≈150 W (iTPM v1.2);
PHAROS2 digital signal processing with iTPM

Implementation of beamforming in the iTPM FPGAs for 24 elements, single-pol., four beams, with ≈275 MHz BW. Each beam provided with integrated spectra (pulsar search, on-the-fly mapping) and with non integrated spectra (pulsar timing).
Test of iTPM beamforming on the BEST2N section (eight cylindrical-parabolic elements) of the Medicina Northern Cross cylindrical-parabolic transit radio telescope.
Future testing

Warm Section and Digital backend due at JB in early 2019 for integration. Bench tests and trolley-mounted sky test.

Mount on Lovell; improve $\eta$; interferometry with eMERLIN
Summary

• Original PHAROS system demonstrated
  $T_{\text{sys}} \sim 50$ K

• Aim of PHAROS2 project to improve performance and implement digital backend
  - Low noise amplifiers
  - Vacuum window
  - Warm module, IFoF, iTPM

• Deploy on telescope next year

Then in a good position to bid for full instrument
