PRISMA Day 2018 - Bologna October 16, 2018

PRISMA archive structure

Data description

The final version of the archive will be structured in the following tabs:

Detections tab: fireball data for each camera. Contains:

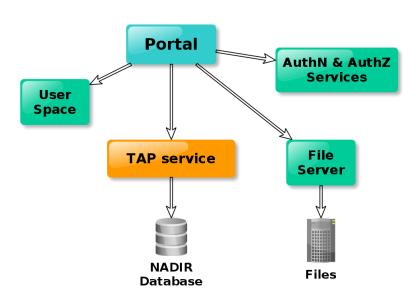

- 1. raw data (*.tar.gz, authentication needed)
- 2. outreach data (*.jpg, public data)
- 3. astrometric and photometric data (*.txt, authentication needed, available soon)

Events tab: data from all the cameras that have detected a single fireball (*.tar.gz, authentication needed)

Captures tab: long-exposures (taken every 10 minutes), available for each active camera, preview available (*.FITS, authentication needed);

Calibrations tab: output coming from the calibrations performed through the captures (data available soon), *tar.gz;

Portal architecture

The portal depends on various web services:

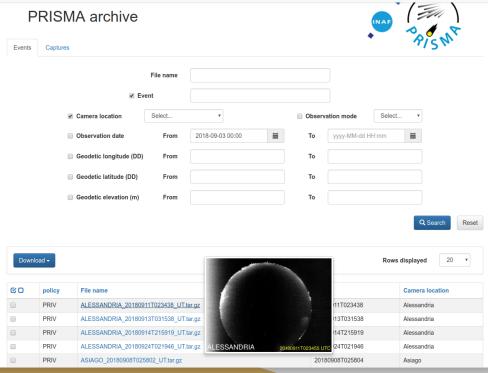

- TAP (Table Access Protocol) service: VO standard for querying astronomical databases
- **UserSpace**: used for store files generated by the users (tar files, CSV, VOTables, ...)
- **FileServer**: given a file name, it knows how to find the file on disk and return it to the users
- Authentication and authorization services: for performing the login

Portal login

☑ New search

- For each station there is an administrator having full access to all PRISMA files.
- Anonymous or non-admin users can query the archive but see only the didactic images.
