Importance of Space Weather

- Solar flares and Coronal Mass Ejections (CMEs) have **dominant roles** in space weather (Eastwood et al. 2017, Temmer 2021).

Importance of Space Weather

- Solar flares and Coronal Mass Ejections (CMEs) have **dominant roles** in space weather (Eastwood et al. 2017, Temmer 2021).
- It is vital to further **develop existing prediction capabilities** through the identification of observable precursors of flares and CMEs.

Importance of Space Weather

- Solar flares and Coronal Mass Ejections (CMEs) have **dominant roles** in space weather (Eastwood et al. 2017, Temmer 2021).
- It is vital to further **develop existing prediction capabilities** through the identification of observable precursors of flares and CMEs.
- Understanding the physical processes of **precursors** is still a challenging task.

Importance of Space Weather

- Solar flares and Coronal Mass Ejections (CMEs) have **dominant roles** in space weather (Eastwood et al. 2017, Temmer 2021).
- It is vital to further **develop existing prediction capabilities** through the identification of observable precursors of flares and CMEs.
- Understanding the physical processes of **precursors** is still a challenging task.
- The most intense solar eruptions originate from the most magnetically complex, and highly twisted **δ -type active regions** (Georgoulis et al. 2019).

Importance of Space Weather

- Solar flares and Coronal Mass Ejections (CMEs) have **dominant roles** in space weather (Eastwood et al. 2017, Temmer 2021).
- It is vital to further **develop existing prediction capabilities** through the identification of observable precursors of flares and CMEs.
- Understanding the physical processes of **precursors** is still a challenging task.
- The most intense solar eruptions originate from the most magnetically complex, and highly twisted **δ -type active regions** (Georgoulis et al. 2019).
- Focus on the observational property of **magnetic helicity flux** in δ -type ARs.

Magnetic helicity flux

- Elsasser (1956) and Woltjer (1958) the **magnetic helicity**:

$$H = \int_V \vec{A} \cdot \vec{B} d^3x$$

- H is conserved in iMHD, when the volume of integration is bounded by a magnetic surface.

Magnetic helicity flux

- Elsasser (1956) and Woltjer (1958) the **magnetic helicity**:

$$H = \int_V \vec{A} \cdot \vec{B} d^3x$$

- H is conserved in iMHD, when the volume of integration is bounded by a magnetic surface.
- H arises from the topological properties of the field, i.e., from the linking, knotting, and twisting of field lines.

Magnetic helicity flux

- Elsasser (1956) and Woltjer (1958) the **magnetic helicity**:

$$H = \int_V \vec{A} \cdot \vec{B} d^3x$$

- H is conserved in iMHD, when the volume of integration is bounded by a magnetic surface.
- H arises from the topological properties of the field, i.e., from the linking, knotting, and twisting of field lines.
- Berger (1984):

$$\left. \frac{dH}{dt} \right|_S = 2 \int_S (\vec{A}_p \cdot \vec{B}_h) \vec{v}_{\perp z} dS - 2 \int_S (\vec{A}_p \cdot \vec{v}_{\perp h}) \vec{B}_z dS$$

Magnetic helicity flux

- *Korsós et al. (2020):*

$$T \equiv \left. \frac{dH}{dt} \right|_S = 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{B}_h)}_{EM} \vec{v}_{\perp z} dS - 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{v}_{\perp h})}_{SH} \vec{B}_z dS$$

Magnetic helicity flux

- *Korsós et al. (2020)*:

$$T \equiv \frac{dH}{dt} \Big|_S = 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{B}_h)}_{EM} \vec{v}_{\perp z} dS - 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{v}_{\perp h}) \vec{B}_z}_{SH} dS$$

- *EM* comes from the twisted magnetic flux tubes emerging into the solar atmosphere.

Magnetic helicity flux

- *Korsós et al. (2020)*:

$$T \equiv \frac{dH}{dt} \Big|_S = 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{B}_h)}_{EM} \vec{v}_{\perp z} dS - 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{v}_{\perp h}) \vec{B}_z}_{SH} dS$$

- **EM** comes from the twisted magnetic flux tubes emerging into the solar atmosphere.
- **SH** comes from the shearing and braiding of the field lines, which is caused by the tangential motions on the solar surface.

Magnetic helicity flux

- *Korsós et al. (2020):*

$$T \equiv \left. \frac{dH}{dt} \right|_S = 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{B}_h)}_{EM} \vec{v}_{\perp z} dS - 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{v}_{\perp h})}_{SH} \vec{B}_z dS$$

- **EM** comes from the twisted magnetic flux tubes emerging into the solar atmosphere.
- **SH** comes from the shearing and braiding of the field lines, which is caused by the tangential motions on the solar surface.
- Investigated the evolution of **EM/SH/T** for **3 flaring and 3 non-flaring ARs**.

Magnetic helicity flux

- *Korsós et al. (2020):*

$$T \equiv \left. \frac{dH}{dt} \right|_S = 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{B}_h)}_{EM} \vec{v}_{\perp z} dS - 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{v}_{\perp h})}_{SH} \vec{B}_z dS$$

- **EM** comes from the twisted magnetic flux tubes emerging into the solar atmosphere.
- **SH** comes from the shearing and braiding of the field lines, which is caused by the tangential motions on the solar surface.
- Investigated the evolution of **EM/SH/T** for **3 flaring and 3 non-flaring ARs**.
- Relationship between the oscillatory behavior of **EM/SH/T** and the associated flare activities.

Magnetic helicity flux

- *Korsós et al. (2020):*

$$T \equiv \left. \frac{dH}{dt} \right|_S = 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{B}_h)}_{EM} \vec{v}_{\perp z} dS - 2 \int_S \underbrace{(\vec{A}_p \cdot \vec{v}_{\perp h})}_{SH} \vec{B}_z dS$$

- **EM** comes from the twisted magnetic flux tubes emerging into the solar atmosphere.
- **SH** comes from the shearing and braiding of the field lines, which is caused by the tangential motions on the solar surface.
- Investigated the evolution of **EM/SH/T** for **3 flaring and 3 non-flaring ARs**.
- Relationship between the oscillatory behavior of **EM/SH/T** and the associated flare activities.
- Their **conjecture** was that **EM/SH/T** have a common period before flare onset.⁴

Data

- **Random sample** of 14 flaring and 14 non-flaring Ars.
(**SHARP – hmi.sharp_cea_720s**)
- The ARs are **selected** based on the following criteria:

Data

- **Random sample** of 14 flaring and 14 non-flaring Ars.
(**SHARP – hmi.sharp_cea_720s**)
- The ARs are **selected** based on the following criteria:
 - the **angular distance** of an AR from the central meridian is $\pm 60^\circ$, to obtain the best possible quality data (Bobra et al. 2014).

Data

- **Random sample** of 14 flaring and 14 non-flaring Ars.
(**SHARP – hmi.sharp_cea_720s**)
- The ARs are **selected** based on the following criteria:
 - the **angular distance** of an AR from the central meridian is $\pm 60^\circ$, to obtain the best possible quality data (Bobra et al. 2014).
 - the AR must have a **δ -spot** configuration.

Data

- **Random sample** of 14 flaring and 14 non-flaring Ars.
(**SHARP – hmi.sharp_cea_720s**)
- The ARs are **selected** based on the following criteria:
 - the **angular distance** of an AR from the central meridian is $\pm 60^\circ$, to obtain the best possible quality data (Bobra et al. 2014).
 - the AR must have a **δ -spot** configuration.
 - the flaring ARs must be the location of **at least one X-class flare**.

Data

- **Random sample** of 14 flaring and 14 non-flaring Ars.
(**SHARP – hmi.sharp_cea_720s**)
- The ARs are **selected** based on the following criteria:
 - the **angular distance** of an AR from the central meridian is $\pm 60^\circ$, to obtain the best possible quality data (Bobra et al. 2014).
 - the AR must have a **δ -spot** configuration.
 - the flaring ARs must be the location of **at least one X-class flare**.
 - the non-flaring ARs should not be the host of flares larger than M5.

Data

- **Random sample** of 14 flaring and 14 non-flaring Ars.

(SHARP – hmi.sharp_cea_720s)

- The ARs are **selected** based on the following criteria:
 - the **angular distance** of an AR from the central meridian is $\pm 60^\circ$, to obtain the best possible quality data (Bobra et al. 2014).
 - the AR must have a **δ -spot** configuration.
 - the flaring ARs must be the location of **at least one X-class flare**.
 - the non-flaring ARs should not be the host of flares larger than M5.
 - the AR cannot be associated with fast CMEs (Here, we define $\geq 750 \text{ km s}^{-1}$).

Wavelet analysis

- Wavelet analysis on **both original and smoothed time series** of EM/SH/T.

Wavelet analysis

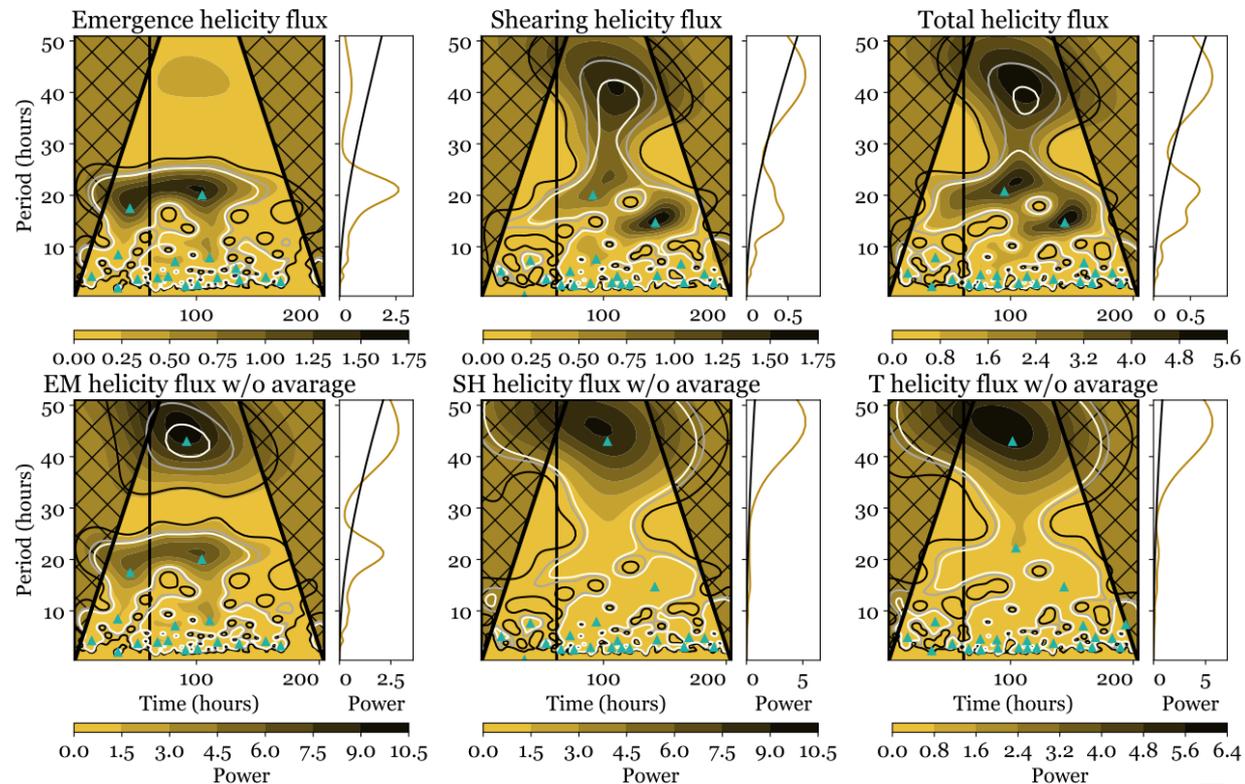

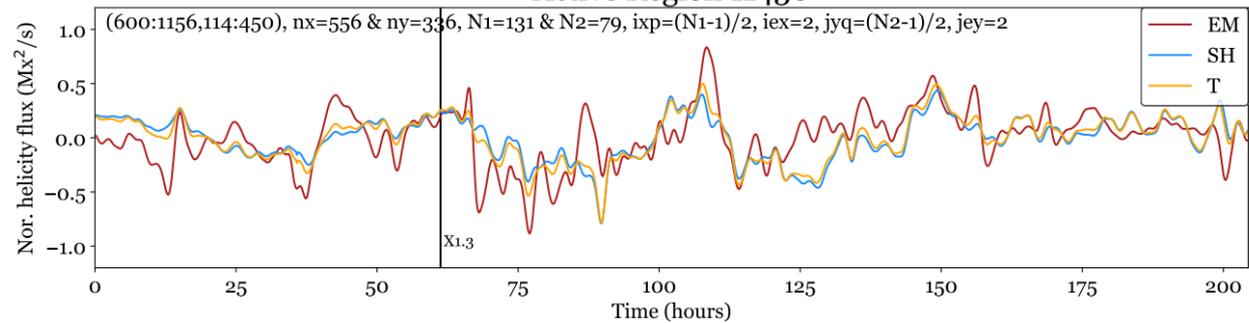

- Wavelet analysis on **both original and smoothed time series** of EM/SH/T.
- **Smoothing** was done by 24 hrs that was subtracted from the original data in order to damp out the 12 and 24 hrs SDO artifact (Smirnova et al. 2013).

Wavelet analysis

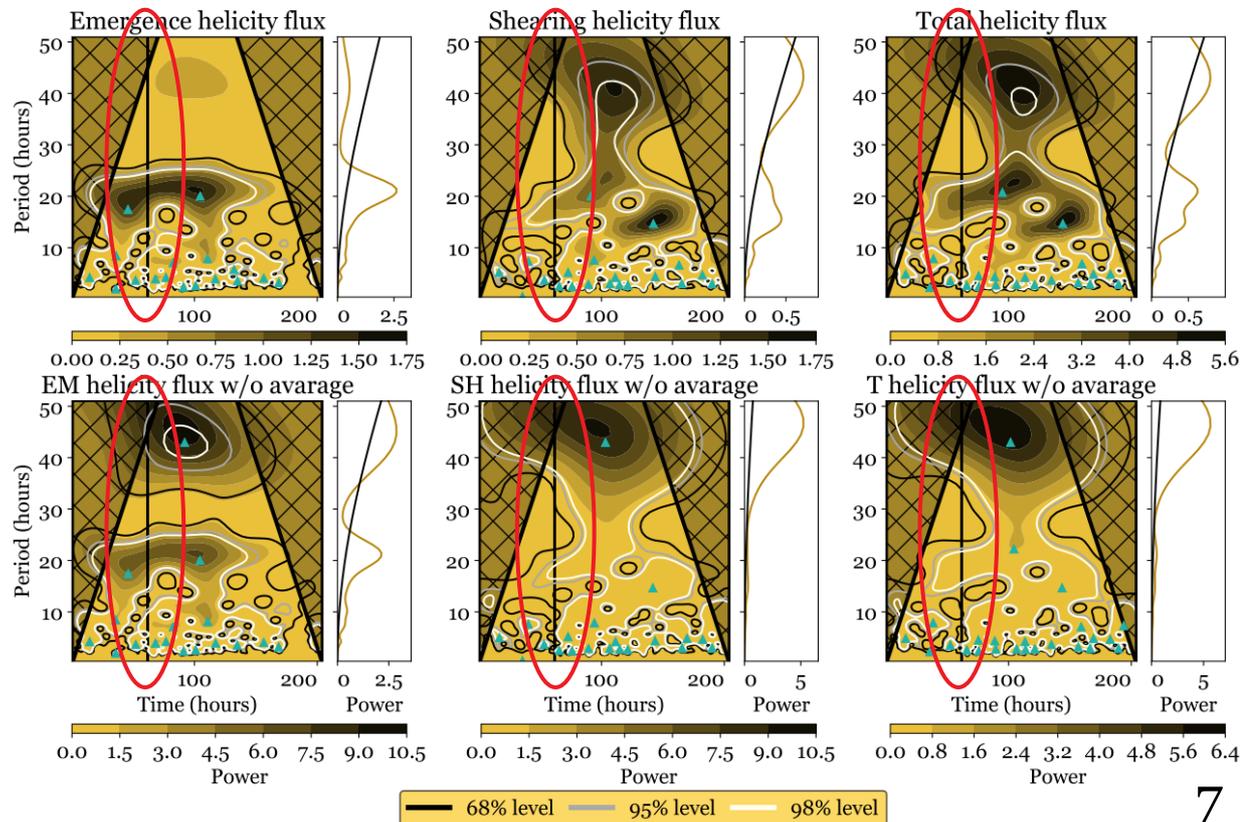

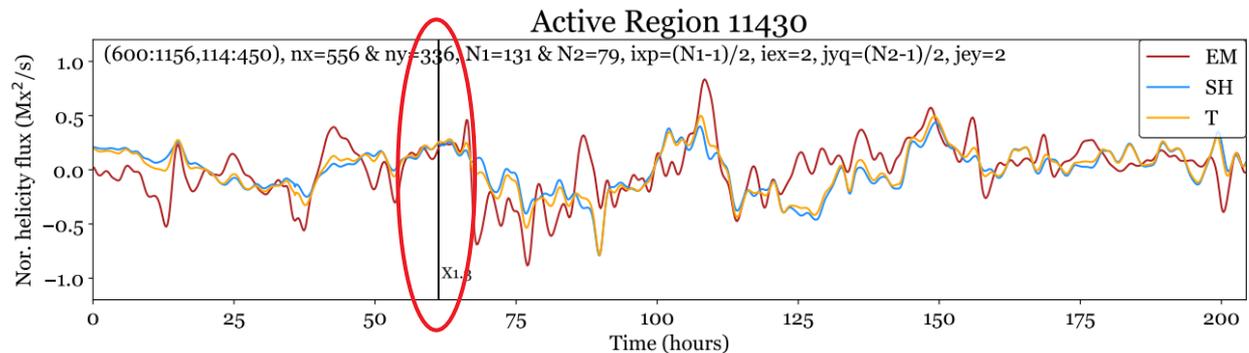

- Wavelet analysis on **both original and smoothed time series** of EM/SH/T.
- **Smoothing** was done by 24 hrs that was subtracted from the original data in order to damp out the 12 and 24 hrs SDO artifact (Smirnova et al. 2013).
- From the wavelet power spectrum (WPS), global power spectra (GPS) are calculated through averaging the WPS over time.
- **1 σ level.**

- **Errors** of the mean periods are estimated with bootstrap, re-sampled 10.000 times each.

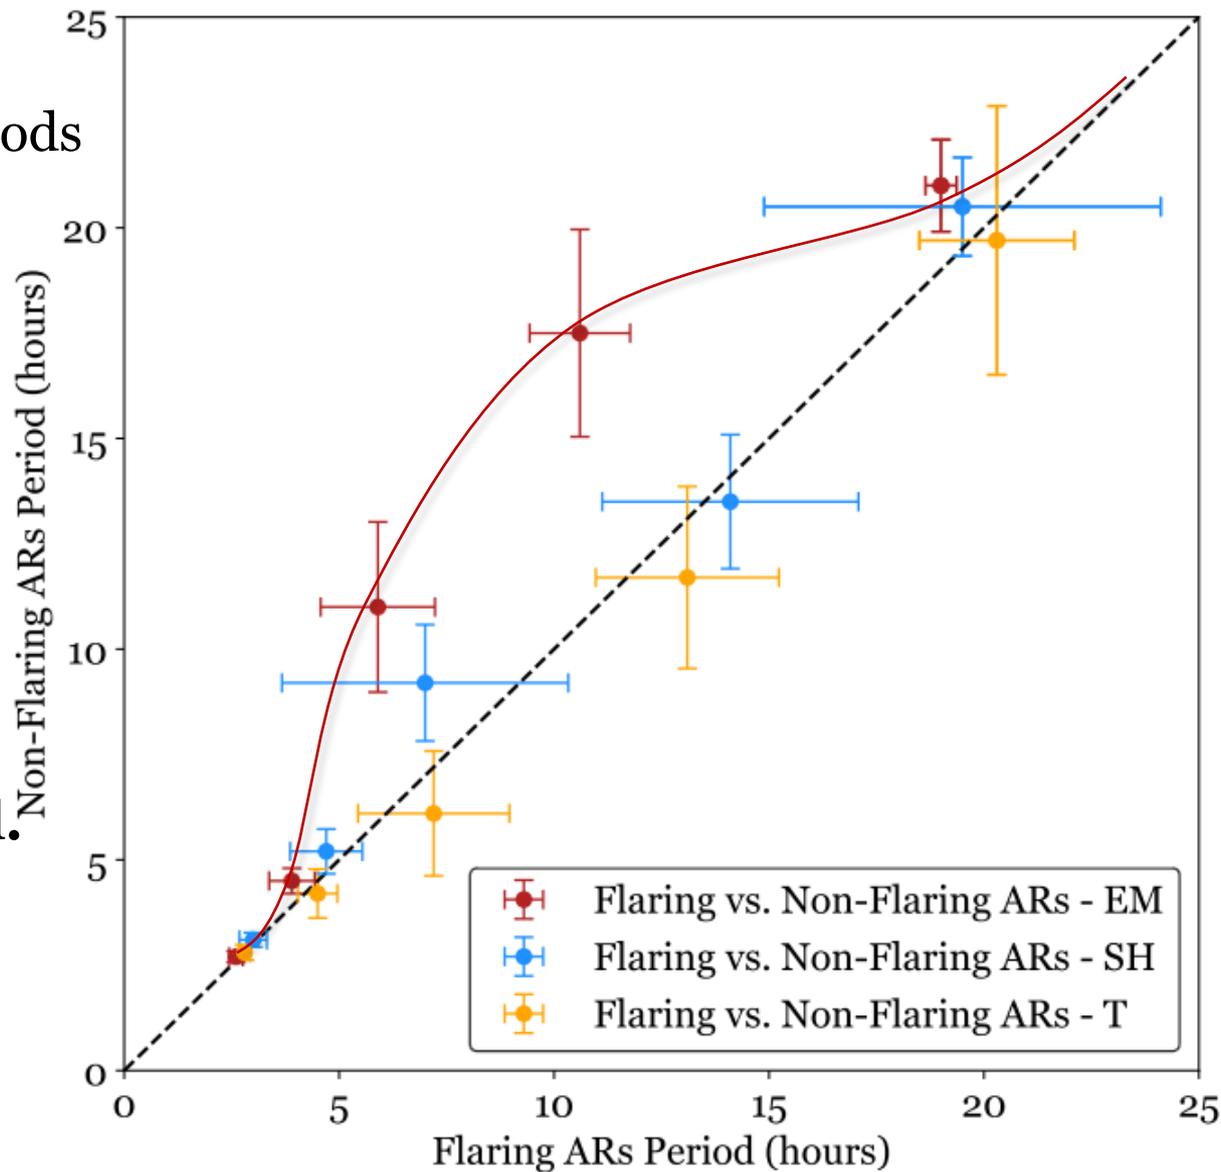

Dashed black line shows the one-to-one correspondence between flaring and non-flaring periodicities.

- **Errors** of the mean periods are estimated with bootstrap, re-sampled 10.000 times each.

Dashed black line shows the one-to-one correspondence between flaring and non-flaring periodicities.

- **EM** periodicities are significantly deviated.

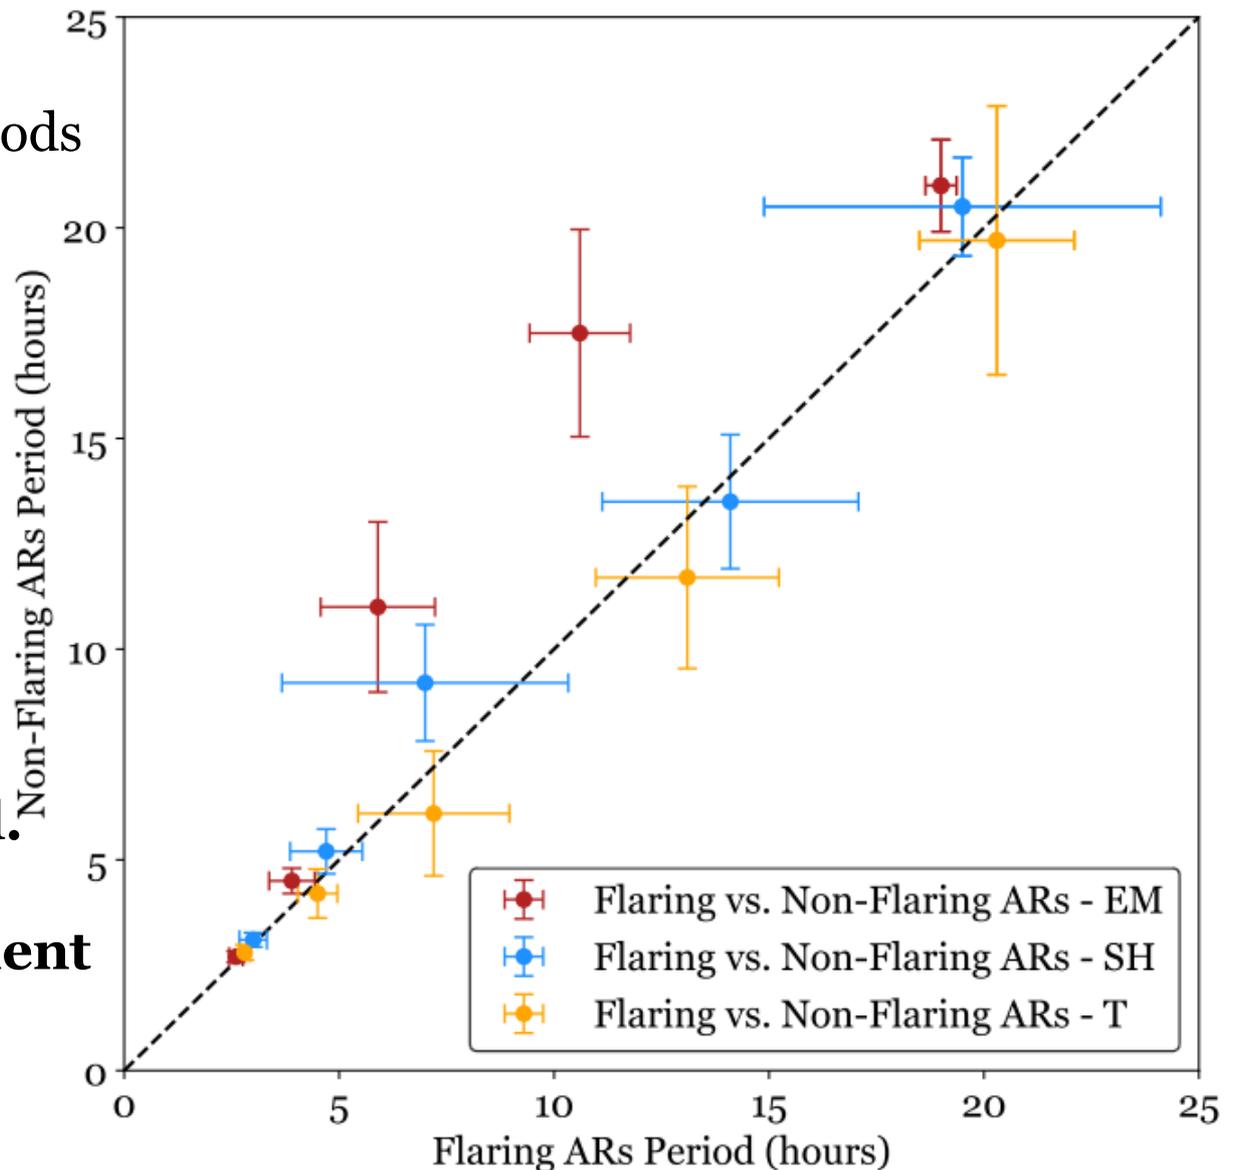

- **Errors** of the mean periods are estimated with bootstrap, re-sampled 10.000 times each.

Dashed black line shows the one-to-one correspondence between flaring and non-flaring periodicities.

- **EM** periodicities are significantly deviated.

- **EM** has a more prominent role in the flare-CME triggering processes.

EM component

- We also **determined the harmonics** for each case of the period peaks of the oscillatory behaviour of **EM/SH/T** components.

EM component

- We also **determined the harmonics** for each case of the period peaks of the oscillatory behaviour of **EM/SH/T** components.
- From this, we can see that only the **peaks appearing in the EM of flaring ARs** are the ones that follow the properties of the harmonics well for an oscillatory **waveguide system**.

EM component

- We also **determined the harmonics** for each case of the period peaks of the oscillatory behaviour of **EM/SH/T** components.
- From this, we can see that only the **peaks appearing in the EM of flaring ARs** are the ones that follow the properties of the harmonics well for an oscillatory **waveguide system**.
- Such a **clear harmonic property** is not detected in the different flux components of flaring or non-flaring ARs.

Summary and Conclusions

- Analyzed the **EM**/**SH**/**T** evolution of **14 flaring** and **14 non-flaring ARs**.

Summary and Conclusions

- Analyzed the **EM/SH/T** evolution of **14 flaring** and **14 non-flaring ARs**.
- For flaring and non-flaring ARs, the **EM/SH/T periodicities occur in bands**.
 - (i) 2-9 hours, (ii) 11-14 hours, and (iii) 19-21 hours.

Summary and Conclusions

- Analyzed the **EM/SH/T** evolution of **14 flaring** and **14 non-flaring ARs**.
- For flaring and non-flaring ARs, the **EM/SH/T periodicities occur in bands**.
 - (i) 2-9 hours, (ii) 11-14 hours, and (iii) 19-21 hours.
- The distribution of **EM/SH/T** peak periodicities were fitted using GMM.

Summary and Conclusions

- Analyzed the **EM/SH/T** evolution of **14 flaring** and **14 non-flaring ARs**.
- For flaring and non-flaring ARs, the **EM/SH/T periodicities occur in bands**.
 - (i) 2-9 hours, (ii) 11-14 hours, and (iii) 19-21 hours.
- The distribution of **EM/SH/T** peak periodicities were fitted using GMM.
- The GMM-fitted **EM** peaks for flaring ARs shows **1/n-dependence** ($n=1,2,3,\dots$).

Summary and Conclusions

- Analyzed the **EM/SH/T** evolution of **14 flaring** and **14 non-flaring ARs**.
- For flaring and non-flaring ARs, the **EM/SH/T periodicities occur in bands**.
 - (i) 2-9 hours, (ii) 11-14 hours, and (iii) 19-21 hours.
- The distribution of **EM/SH/T** peak periodicities were fitted using GMM.
- The GMM-fitted **EM** peaks for flaring ARs shows **1/n-dependence** ($n=1,2,3,\dots$).
- The correlation between the central periodicities of the flaring and non-flaring ARs shows: **EM behaves significantly differently for flaring regions**.

Summary and Conclusions

- Analyzed the **EM/SH/T** evolution of **14 flaring and 14 non-flaring ARs**.
- For flaring and non-flaring ARs, the **EM/SH/T periodicities occur in bands**.
 - (i) 2-9 hours, (ii) 11-14 hours, and (iii) 19-21 hours.
- The distribution of **EM/SH/T** peak periodicities were fitted using GMM.
- The GMM-fitted **EM** peaks for flaring ARs shows **1/n-dependence** ($n=1,2,3,\dots$).
- The correlation between the central periodicities of the flaring and non-flaring ARs shows: **EM behaves significantly differently for flaring regions**.
- The **presence of long periods** in **EM** and **T** suggests that the **EM component may play a crucial role in the formation of flares**, especially when:
