# MOTIVATION AND DATA SELECTION

*Energetic electrons*

We compare the flare HXR spectra with in-situ near-relativistic electron spectra which are assumed to represent the same accelerated electron population

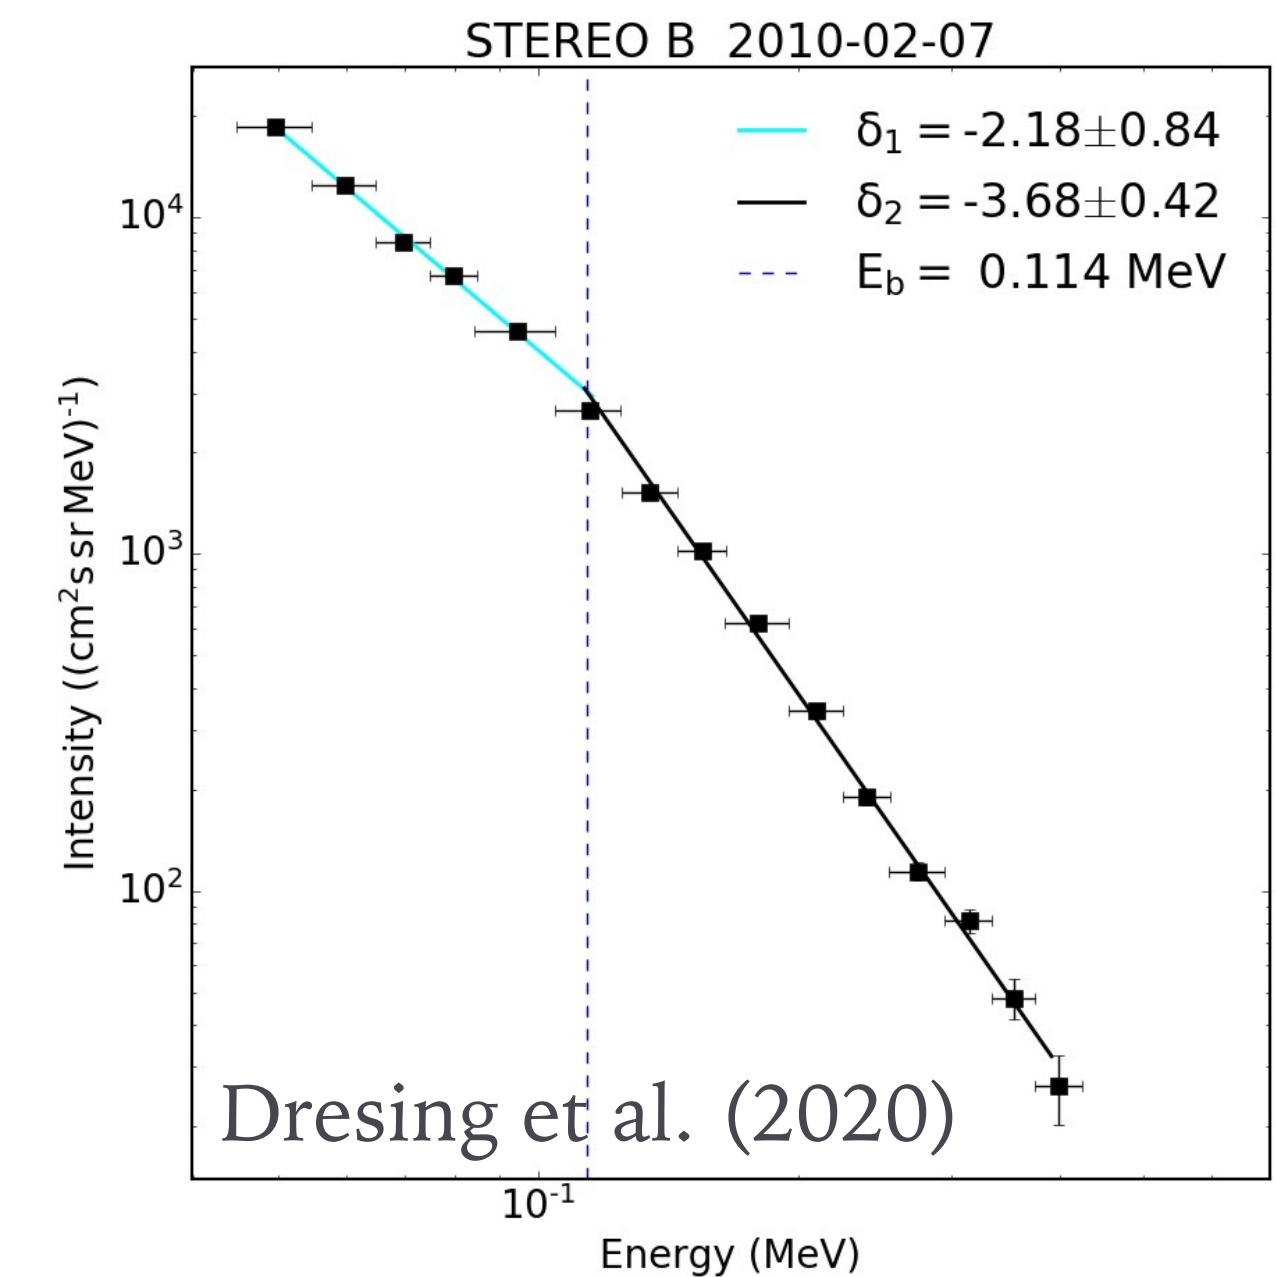

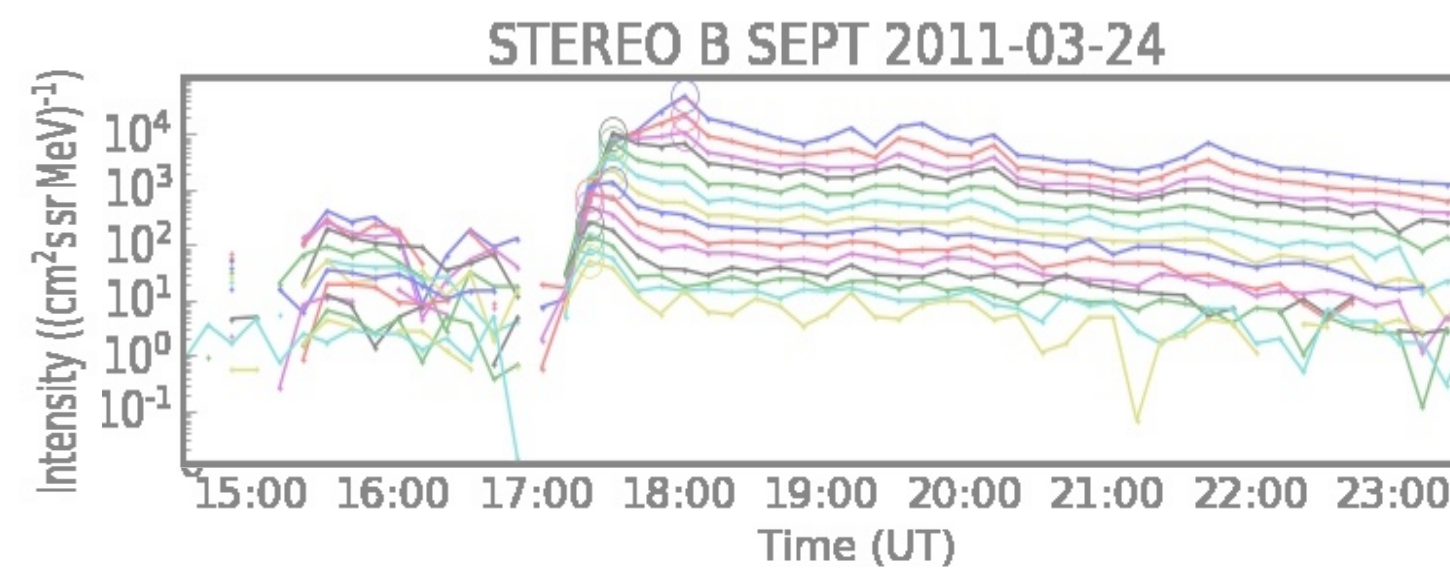

Hard X-Ray (HXR) spectrum observed by RHESSI

# THE CHOICE OF THE CORRECT SPECTRAL PART OF THE IN-SITU SPECTRUM

Hard X-Ray (HXR) spectrum observed by RHESSI

Is the footprint of the flare acceleration still observed at 1AU?

Does the spectrum change from the Sun to 1AU?

Dresing et al. (2020)

# THE CHOICE OF THE CORRECT SPECTRAL PART OF THE IN-SITU SPECTRUM

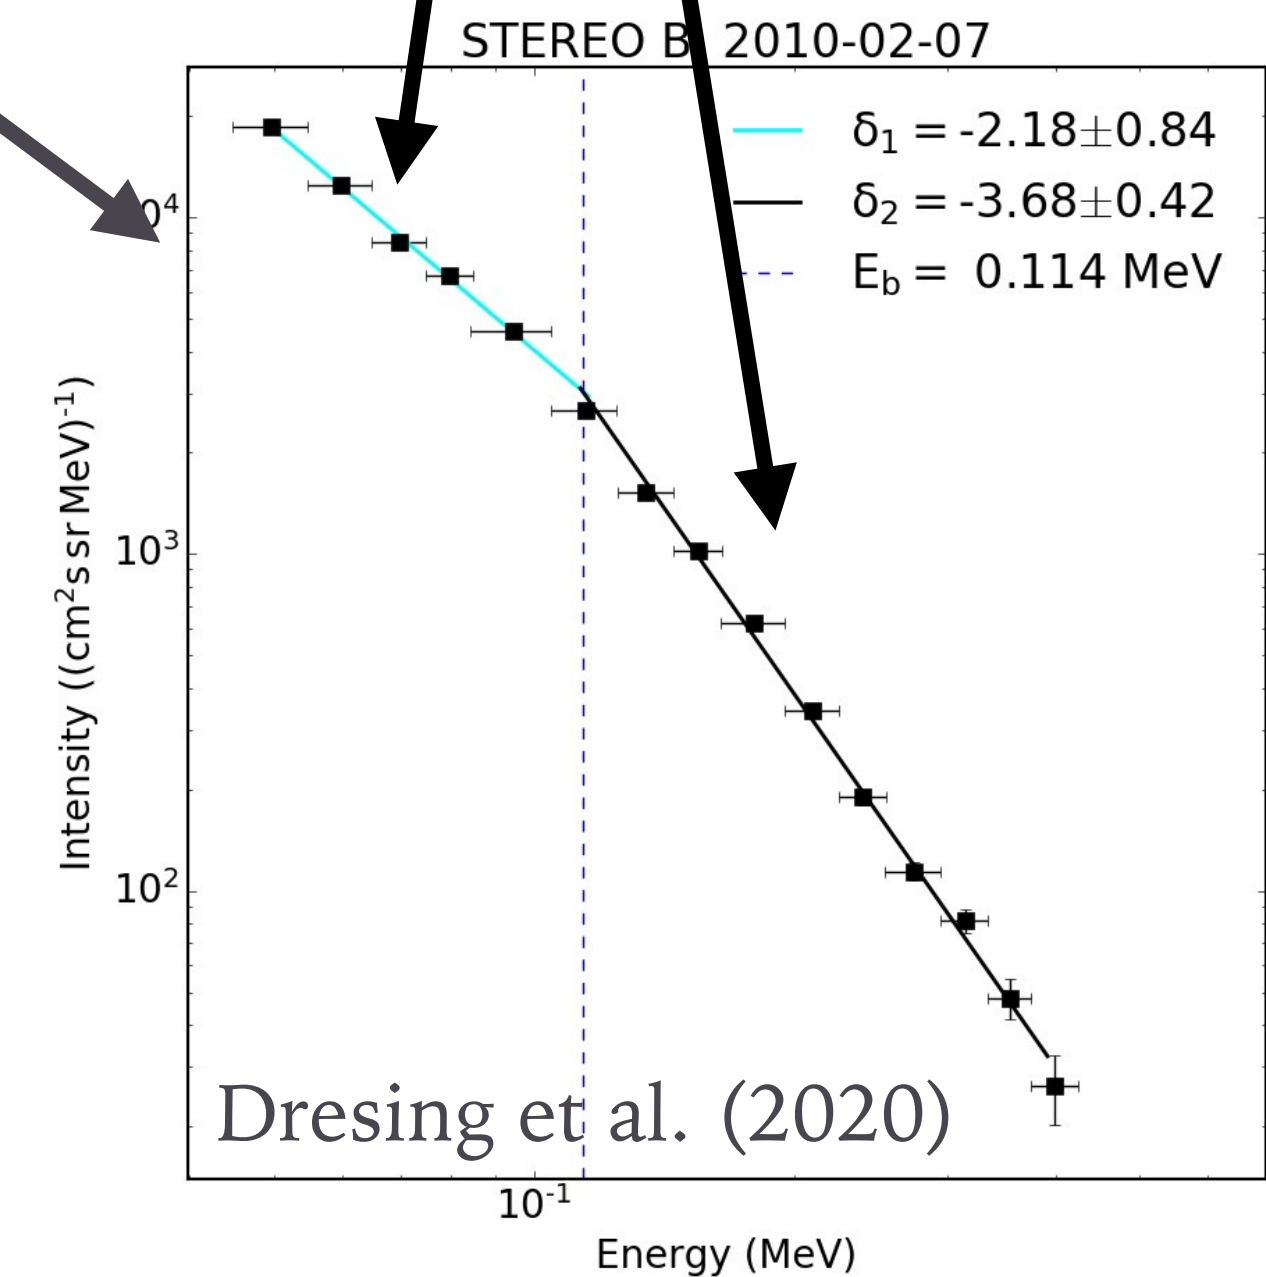

Hard X-Ray (HXR) spectrum observed by RHESSI

However, near-relativistic electron spectra reveal often a double power law shape

Which part of the in-situ spectrum should be used for correlation?

Is the footprint of the flare acceleration still observed at 1AU?

Does the spectrum change from the Sun to 1AU?

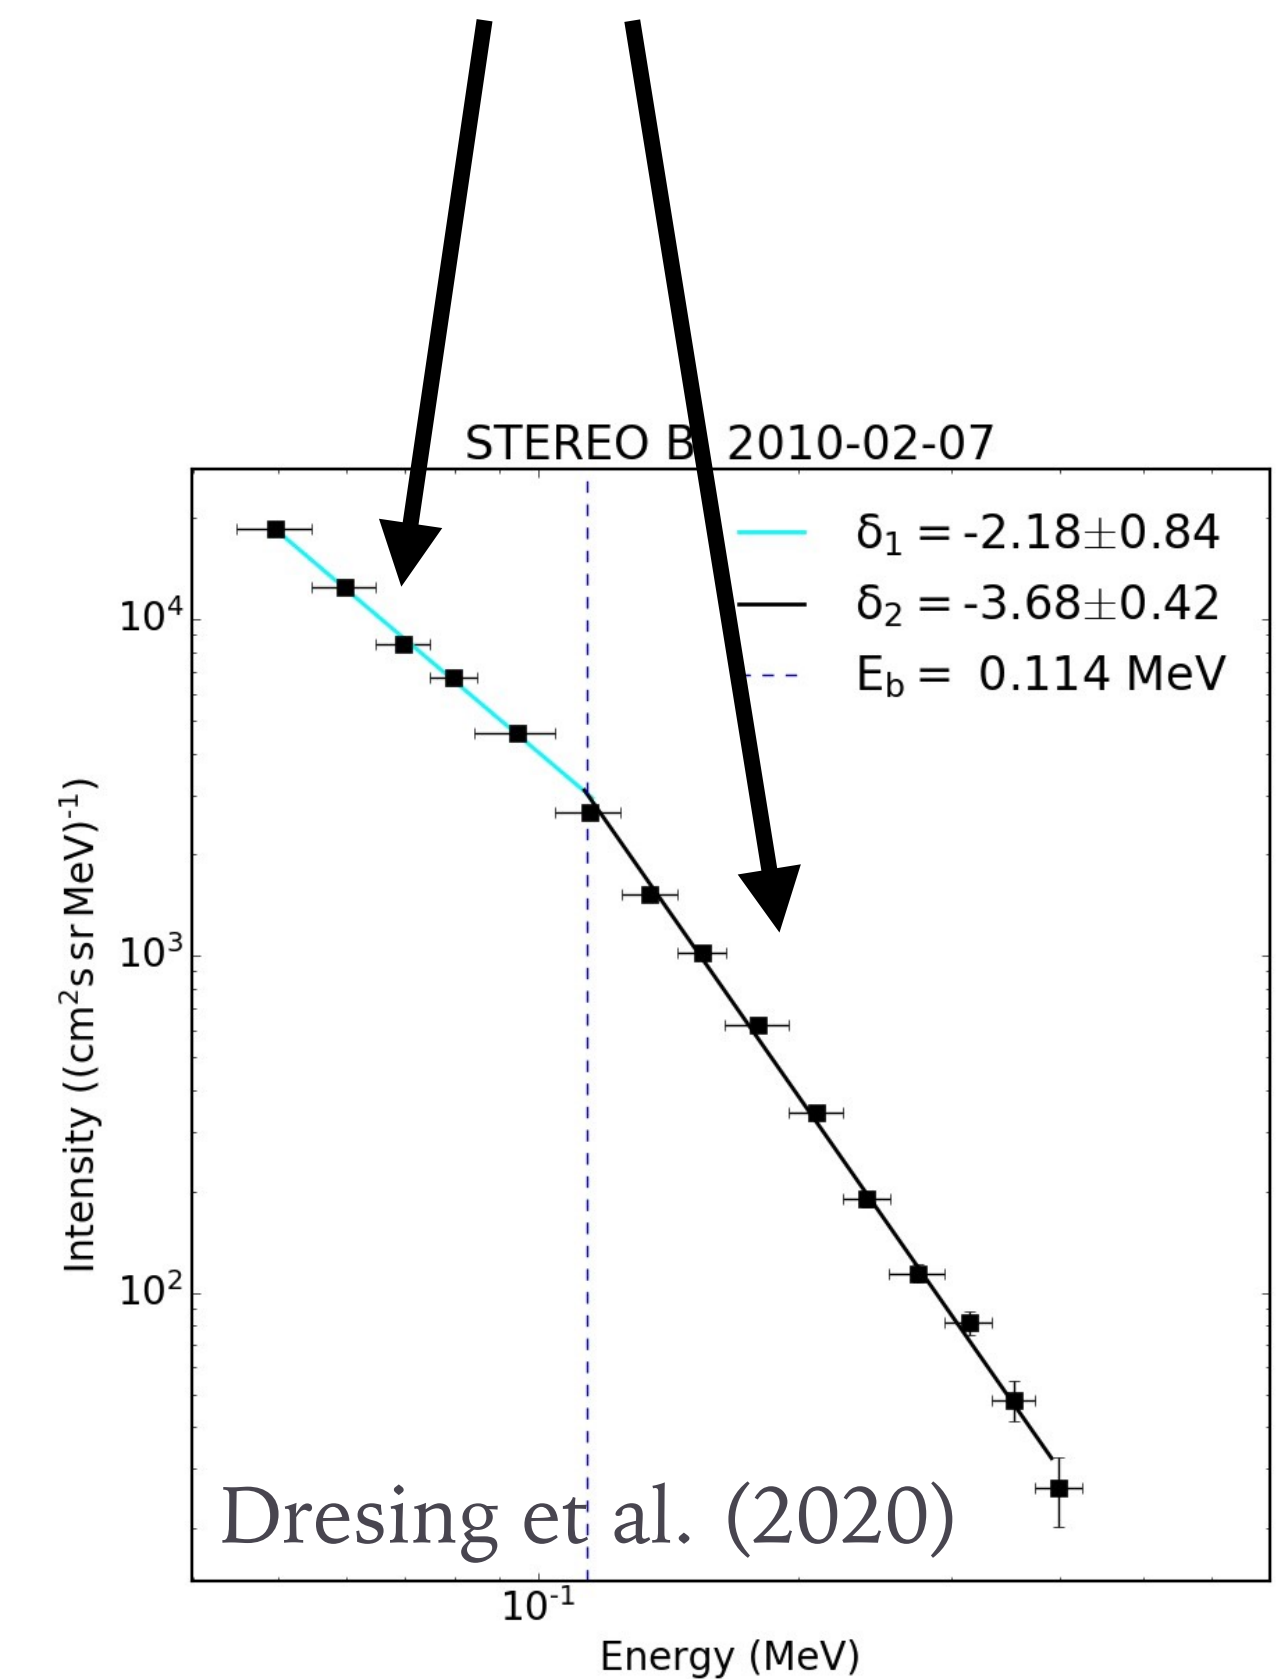

# MODIFICATIONS OF THE ORIGINAL SPECTRUM

There are at least two potential transport-related processes that can cause spectral transitions:

- 1) The generation of Langmuir turbulence by a few keV electrons (which results into type III radio bursts). This causes a depression of the low energy part of the spectrum.

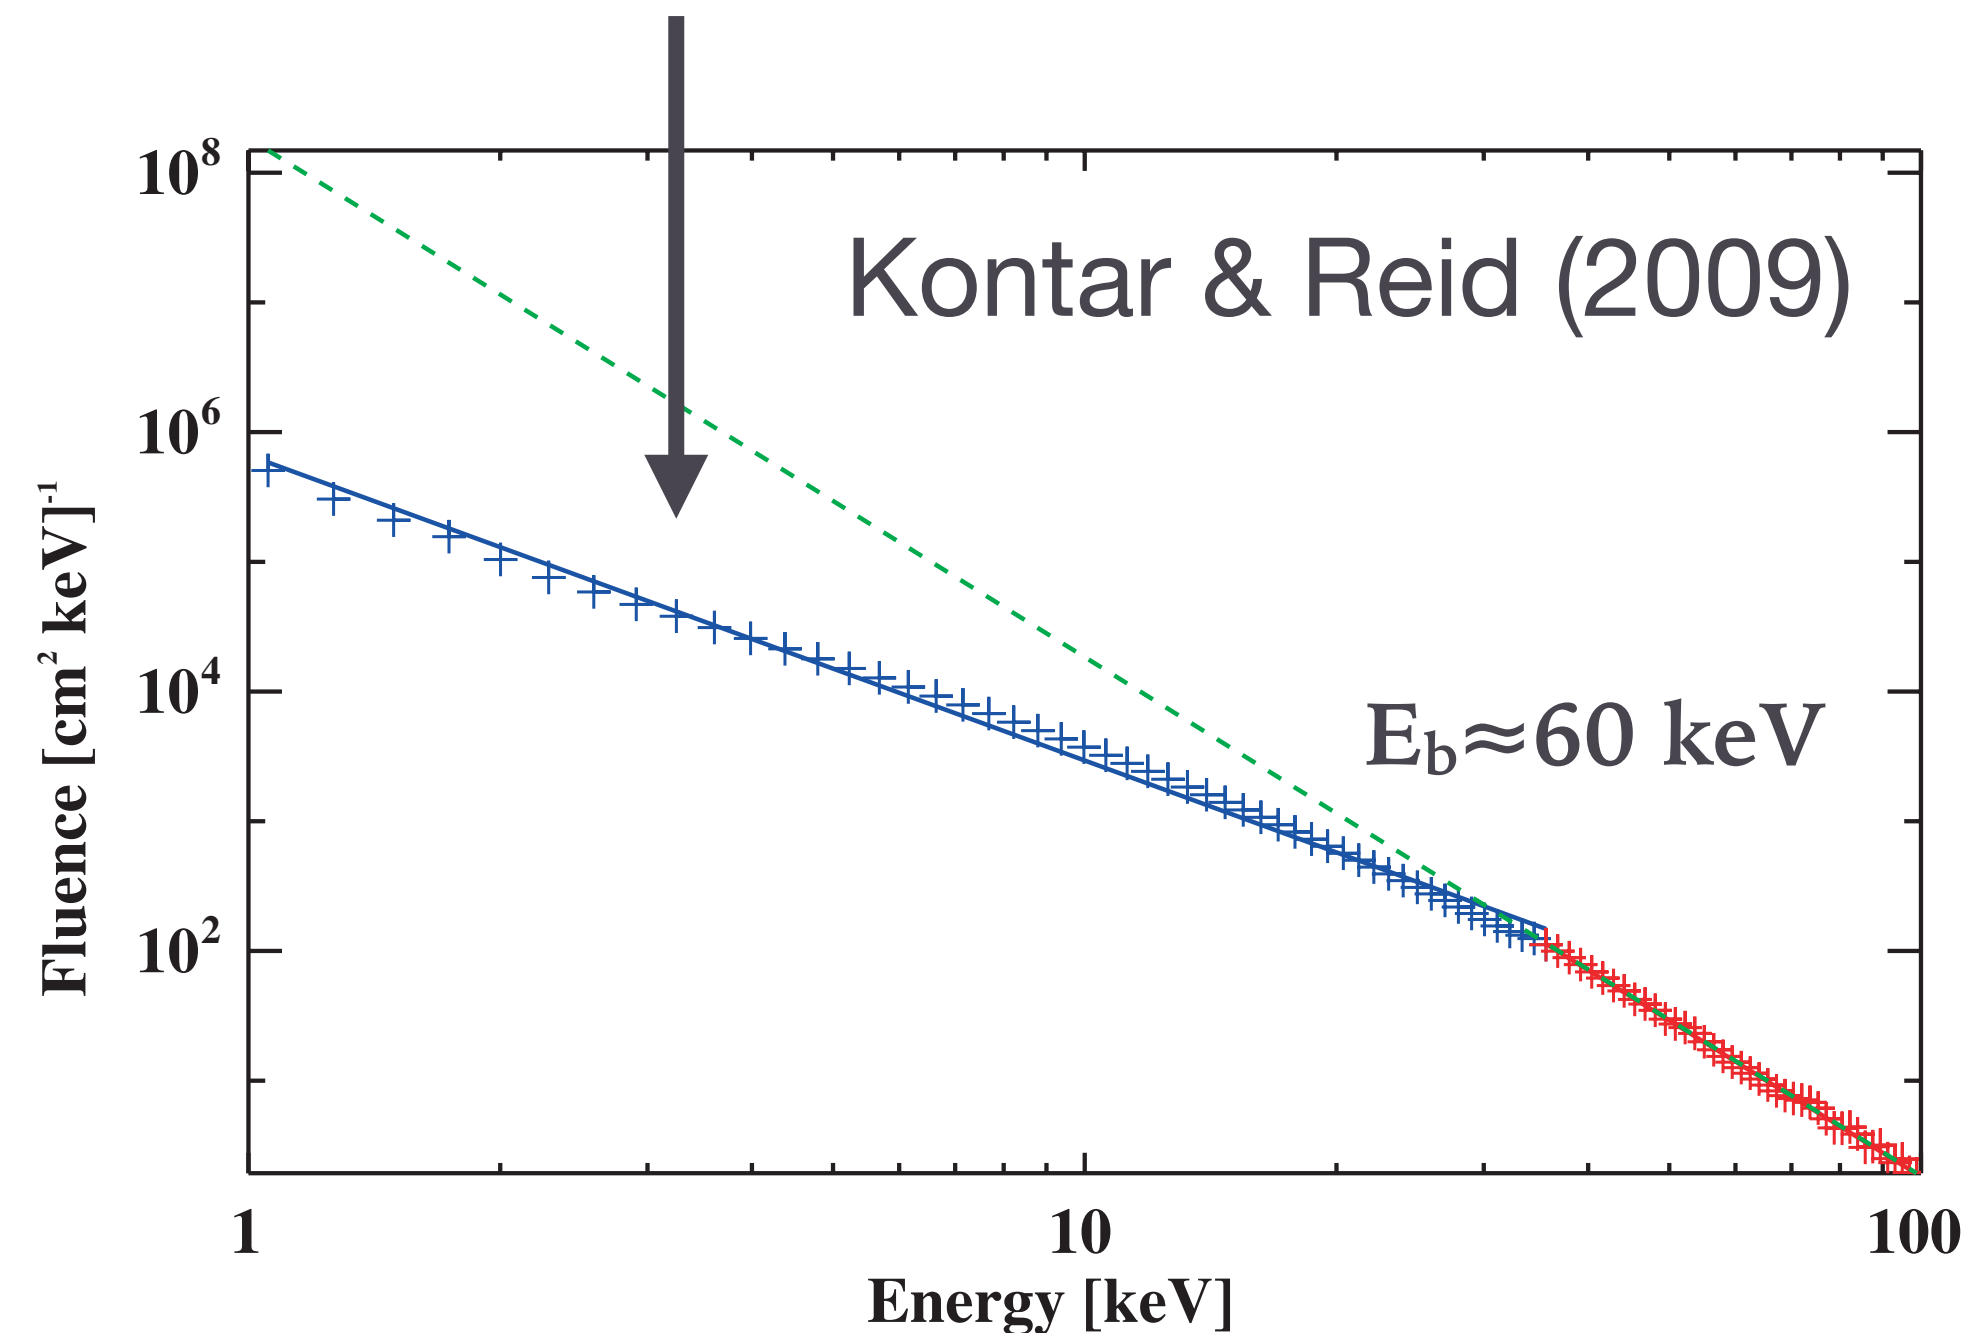

Which part of the in-situ spectrum should be used for correlation?

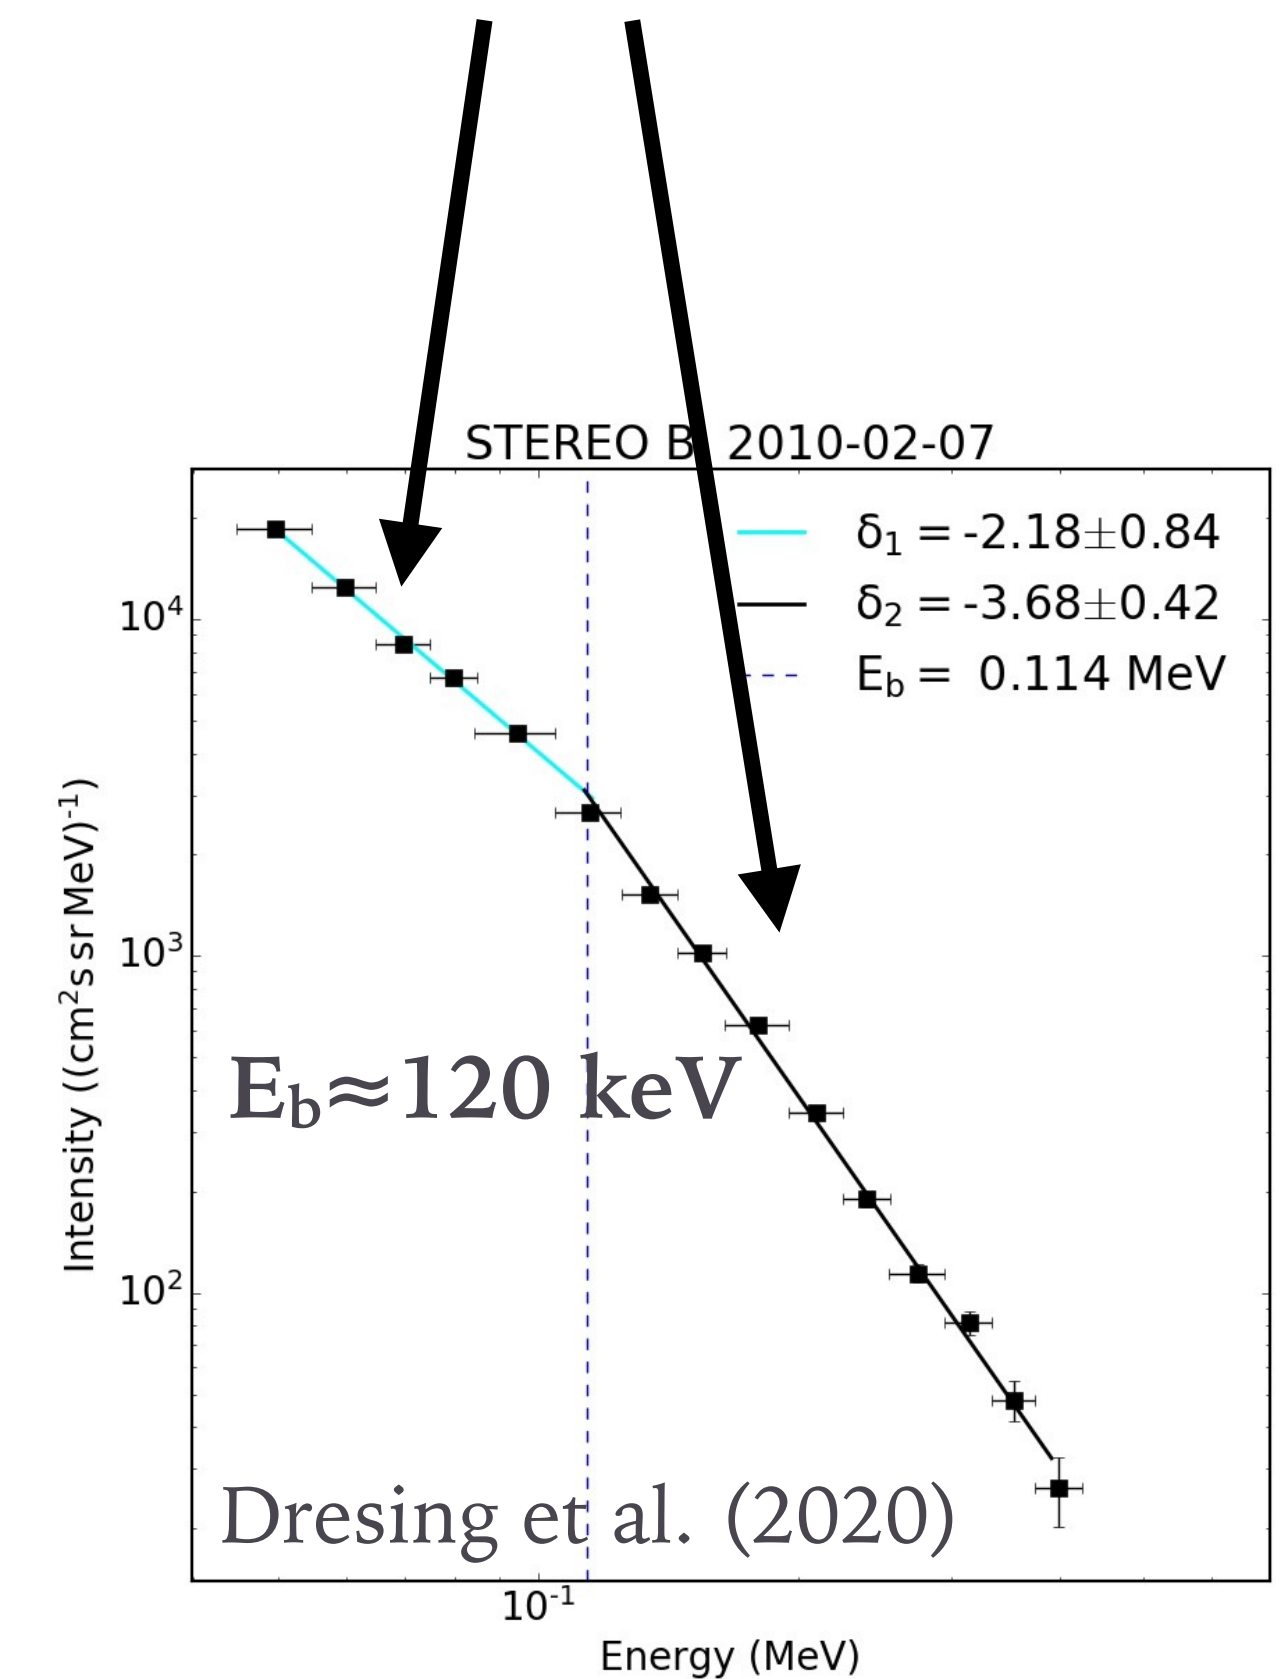

# MODIFICATIONS OF THE ORIGINAL SPECTRUM

There are at least two potential transport-related processes that can cause spectral transitions:

- 1) The generation of Langmuir turbulence by a few keV electrons (which results into type III radio bursts). This causes a depression of the low energy part of the spectrum.
- 2) Pitch-angle scattering which is stronger at higher energies ( $\approx 100$  keV). This causes a 'loss' of high energy electrons in the peak spectrum.

Which part of the in-situ spectrum should be used for correlation?

# MODIFICATIONS OF THE ORIGINAL SPECTRUM

There are at least two potential transport-related processes that can cause spectral transitions:

- 1) The generation of Langmuir turbulence by a few keV electrons (which results into type III radio bursts). This causes a depression of the low energy part of the spectrum.
- 2) Pitch-angle scattering which is stronger at higher energies ( $\geq 100$  keV). This causes a 'loss' of high energy electrons in the peak spectrum.

It is therefore possible that two different kinds of spectral breaks exist. These were not yet clearly resolved in a single spacecraft measurement and could also overlap.

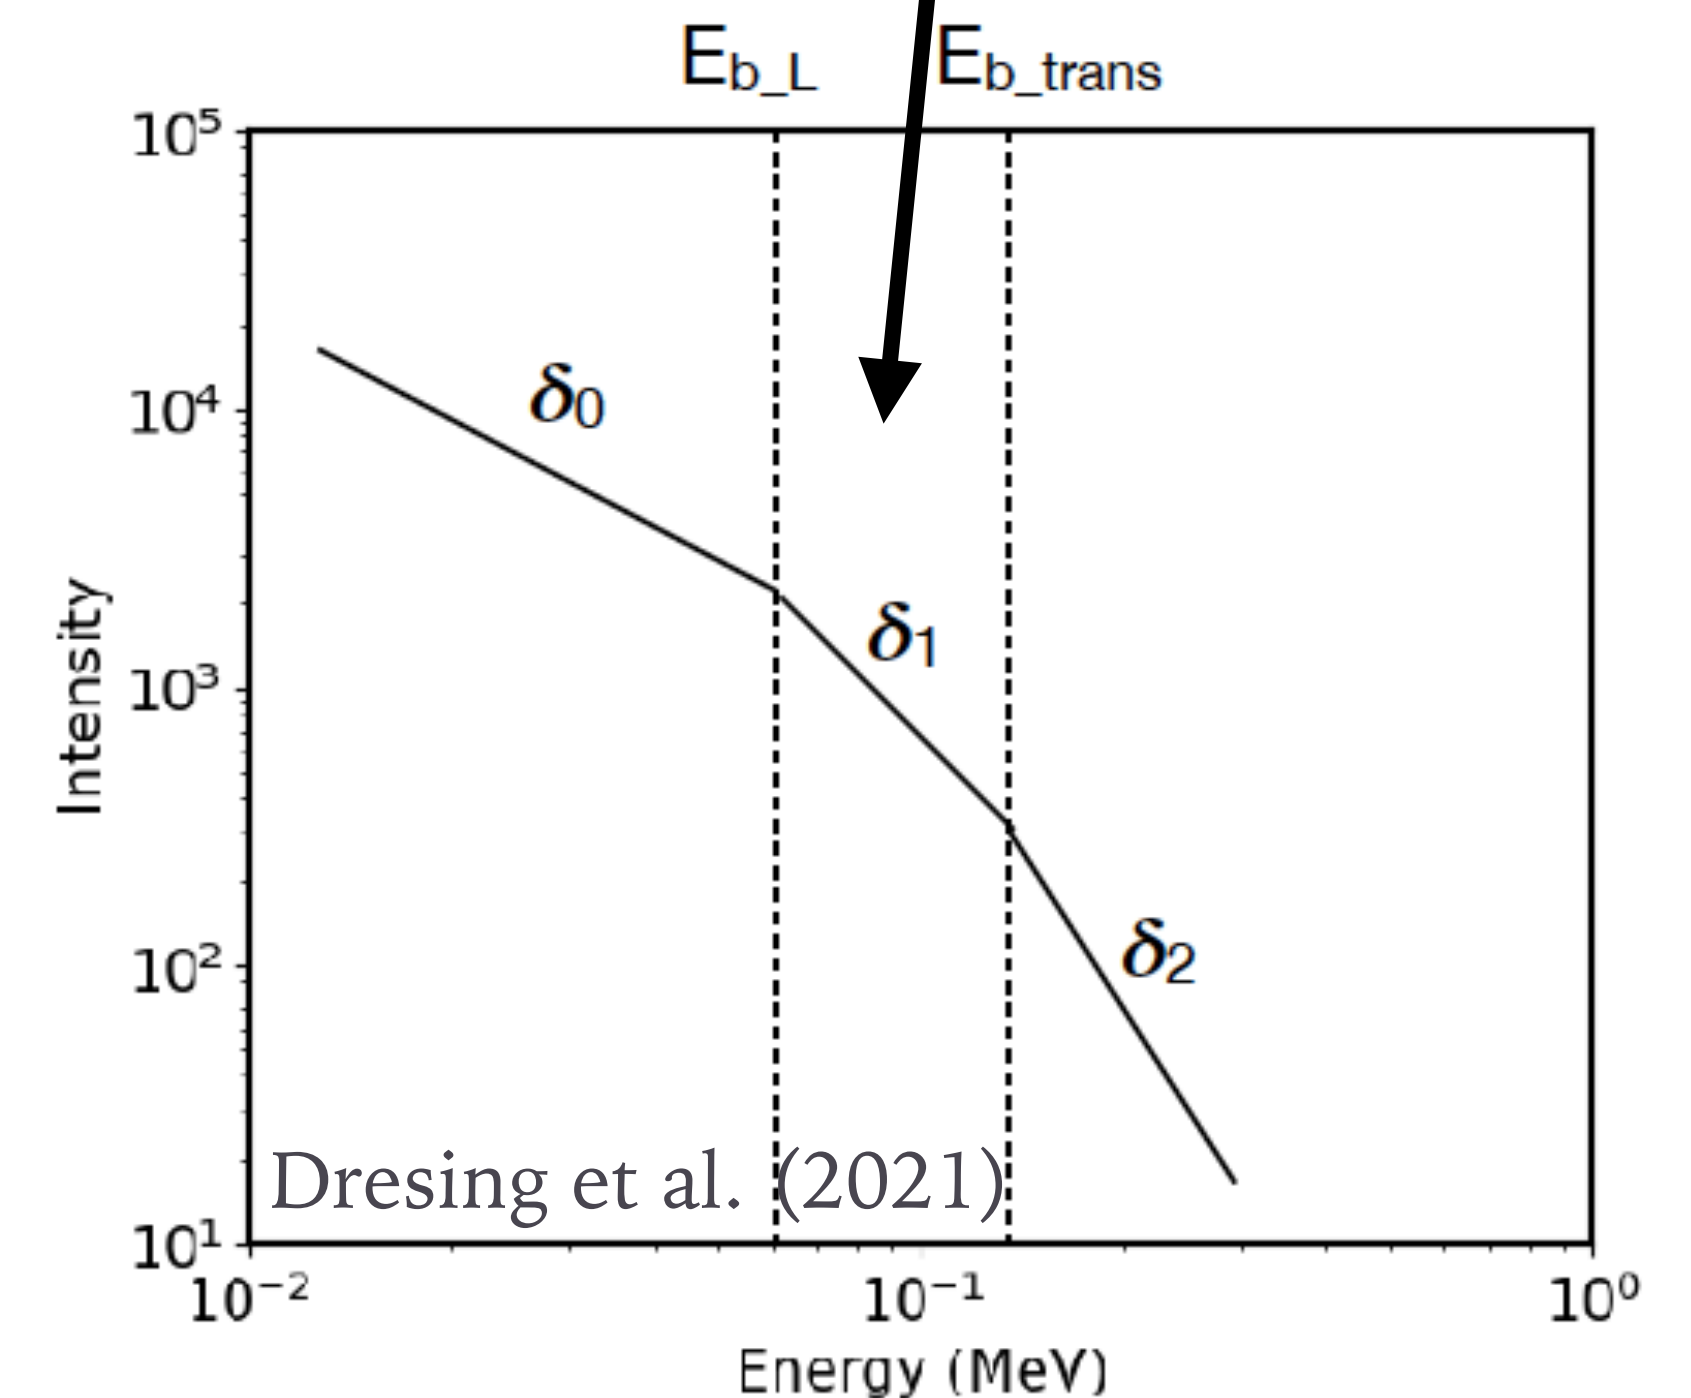

# MODIFICATIONS OF THE ORIGINAL SPECTRUM

There are at least two potential transport-related processes that can cause spectral transitions:

- 1) The generation of Langmuir turbulence by a few keV electrons (which results into type III radio bursts). This causes a depression of the low energy part of the spectrum.
- 2) Pitch-angle scattering which is stronger at higher energies ( $\geq 100$  keV). This causes a 'loss' of high energy electrons in the peak spectrum.

It is therefore possible that two different kinds of spectral breaks exist. These were not yet clearly resolved in a single spacecraft measurement and could also overlap.

Strauss et al. (2020) therefore suggest to use the spectral range between  $\sim 50$ - $100$  keV as it might be least modified by transport effects

# STEREO ELECTRON EVENTS WITH ASSOCIATED RHESSI HXR FLARE OBSERVATIONS

Using RHESSI HXR flare observations and STEREO/SEPT near-relativistic electron observations between 2007 and 2018 we find 17 common events which allow for a spectral comparison

HXR peak time	GOES class	flare location	$\gamma$	$\delta_1$	$\delta_2$	$E_b$ [keV]	s/c
2007/01/24 00:31:24	B5.1	S05W61	$3.2 \pm 0.09$	$3.0 \pm 1.0$	$3.8 \pm 0.6$	79	A
2007/01/24 00:31:24	B5.1	S05W61	$3.2 \pm 0.09$	$2.7 \pm 1.0$	$3.6 \pm 0.9$	107	B
2007/01/24 05:16:09	B6.8	S05W64	$4.1 \pm 0.26$	$3.6 \pm 0.3$	–	–	B
2007/01/24 05:16:09	B6.8	S05W64	$4.1 \pm 0.26$	$3.2 \pm 0.6$	$3.9 \pm 1.3$	98	A
2009/12/22 04:56:10	C7.2	S28W47	$2.7 \pm 0.04$	$2.0 \pm 0.1$	$3.0 \pm 0.2$	122	B
2010/02/08 03:12:24	C6.2	N22E00	$3.4 \pm 0.10$	$2.4 \pm 0.2$	–	–	B
2010/11/12 03:53:41	C1.0	S21E02	$3.7 \pm 0.06$	$3.6 \pm 0.3$	–	–	B
2010/11/12 08:01:54	C1.5	S23W01	$3.9 \pm 0.08$	$2.9 \pm 0.3$	$4.5 \pm 0.5$	118	B
2010/11/17 04:36:44	B7.8	S34E21	$4.3 \pm 0.11$	$1.6 \pm 1.7$	$3.4 \pm 1.0$	69	B
2011/03/24 17:04:34	C9.1	S15E41	$4.1 \pm 0.05$	$2.9 \pm 0.6$	$5.1 \pm 2.3$	195	B
2012/01/12 00:51:58	C1.5	N21E20	$4.9 \pm 0.53$	$4.4 \pm 0.4$	$6.4 \pm 2.0$	87	B
2012/03/25 00:27:54	C3.0	N20E26	$3.4 \pm 0.03$	$2.7 \pm 0.4$	$4.0 \pm 0.9$	110	B
2012/04/16 00:26:14	C1.8	N13E89	$4.9 \pm 0.10$	$4.8 \pm 0.5$	–	–	B
2012/05/07 03:21:58	C2.7	N13E67	$4.4 \pm 0.03$	$2.9 \pm 0.2$	$4.9 \pm 0.6$	106	B
2012/06/27 12:36:00	C3.4	N15E64	$3.7 \pm 0.03$	$2.4 \pm 0.3$	$4.9 \pm 0.6$	90	B
2012/06/28 02:12:24	C2.6	N17E56	$4.3 \pm 0.09$	$2.8 \pm 0.6$	$3.7 \pm 0.4$	90	B
2012/07/01 07:14:44	C5.4	N16E11	$4.3 \pm 0.14$	$3.6 \pm 0.3$	$5.5 \pm 0.7$	104	B
2014/03/19 16:26:14	C3.3	S12E81	$5.9 \pm 0.20$	$3.1 \pm 0.7$	$4.0 \pm 0.7$	101	B
2014/06/09 17:05:04	C8.8	S19E90	$3.5 \pm 0.05$	$2.6 \pm 0.5$	$4.0 \pm 1.4$	90	B

Strauss et al. (2020) therefore suggest to use the spectral range between  $\sim 50$ -100 keV as it might be least modified by transport effects

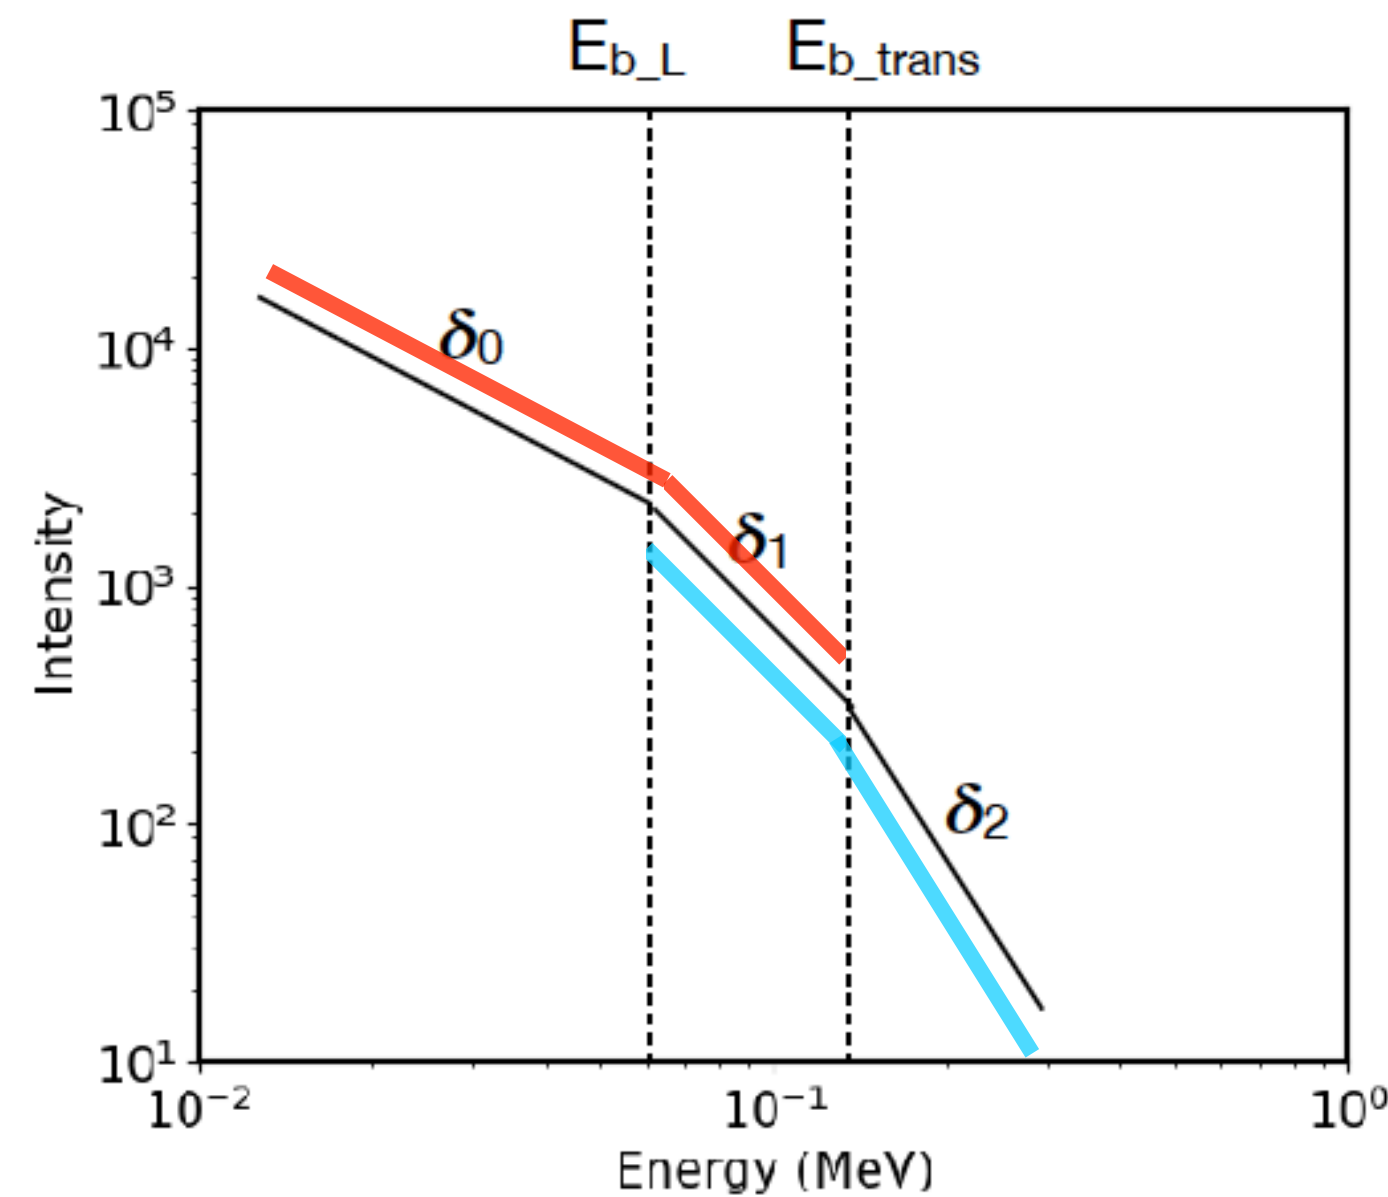

Unfortunately, many spectral breaks of are lying in the suggested range making a choice between the two spectral indices difficult.

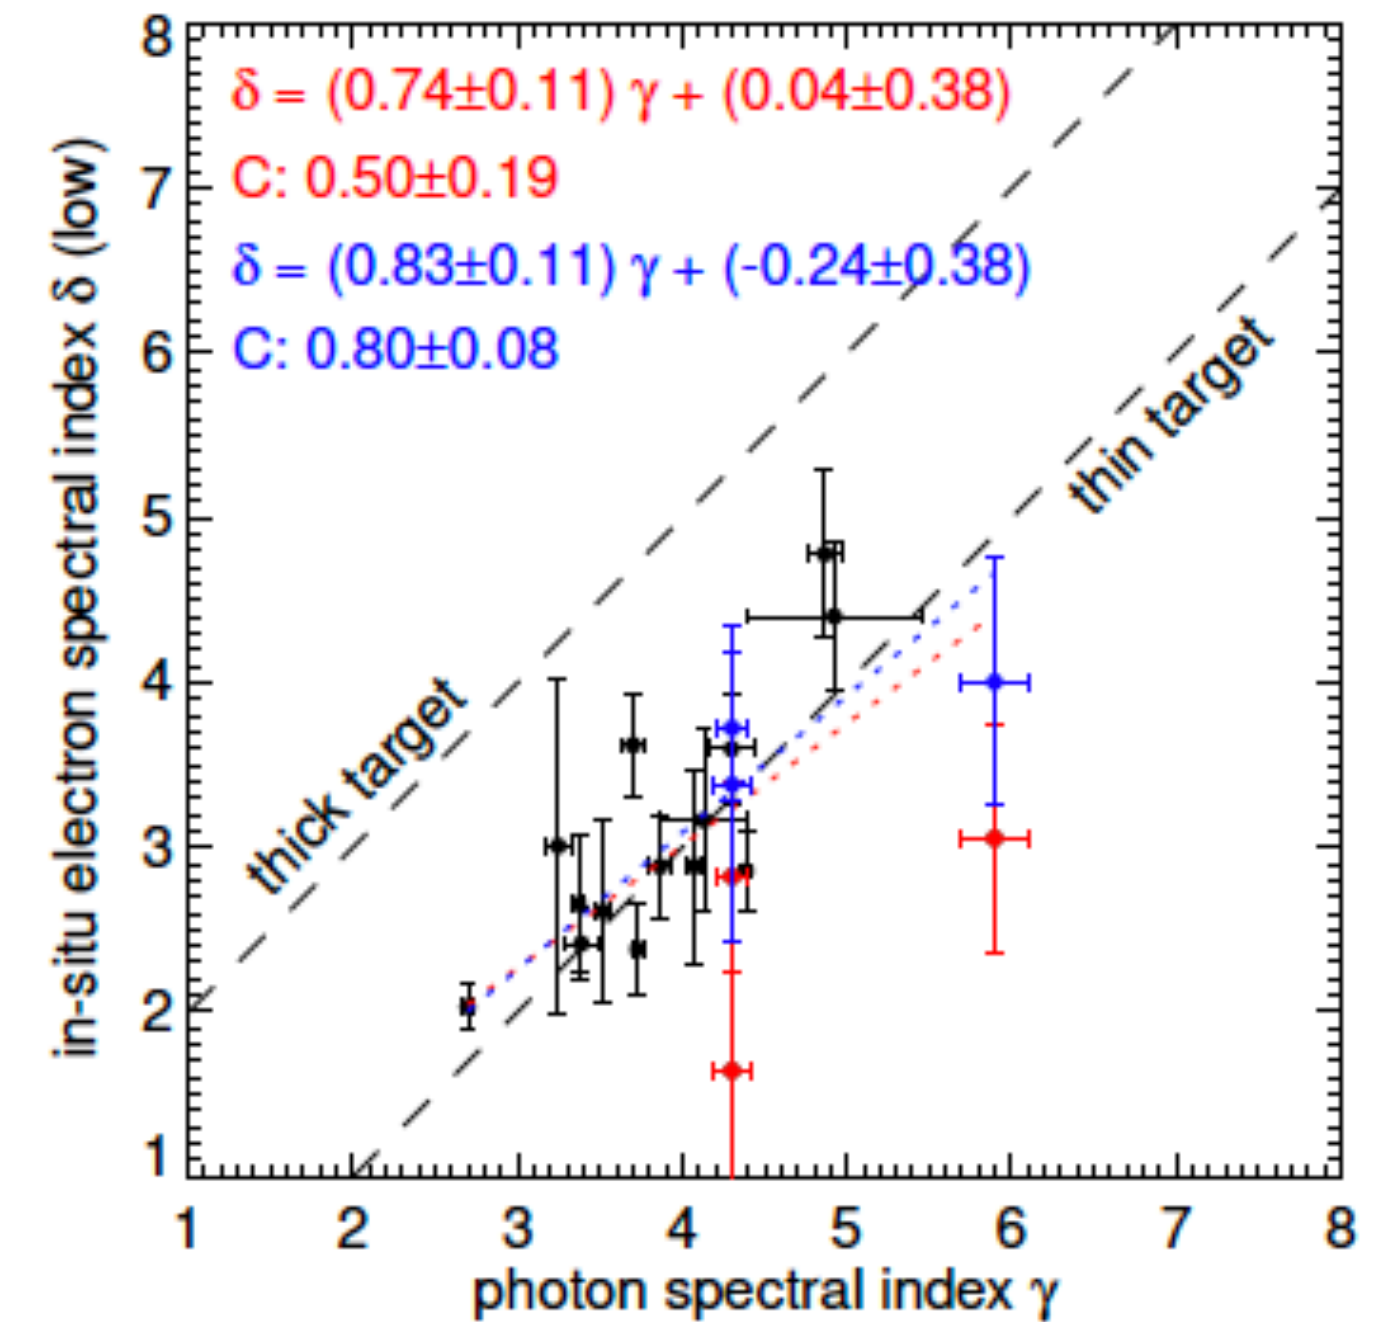

Dresing et al. (2021)

# CORRELATING HXR AND IN-SITU ELECTRON SPECTRAL INDICES

- Correlated HXR spectral index  $\gamma$  separately with the in-situ spectral index  $\delta_{\text{low}}$  and  $\delta_{\text{high}}$
- Good correlation of  $\sim 0.8$  for both sets of value pairs
- Alignment along the thin-target solution (shift toward harder in situ electron spectra) when using  $\delta_{\text{low}}$
- Shift toward the thick-target solution when using  $\delta_{\text{high}}$ .

$\delta_{\text{low}}$

$\delta_{\text{high}}$

# CONNECTING SOLAR FLARE HARD X-RAY SPECTRA TO IN-SITU ELECTRON SPECTRA USING RHESSI AND STEREO/SEPT OBSERVATIONS

## SUMMARY

- ▶ We find clear correlations of  $c \approx 0.8$  between HXR and in-situ electron spectra (despite the frequent presence of CMEs and the observed electron onsets delays)
- ▶ The choice of the in-situ spectral index for comparison with the HXR spectrum is not straightforward and can strongly influence the results (thin-target vs. thick-target solution)
- ▶ Transport effects can diminish the imprint of injected spectrum

Flare

Energetic electrons

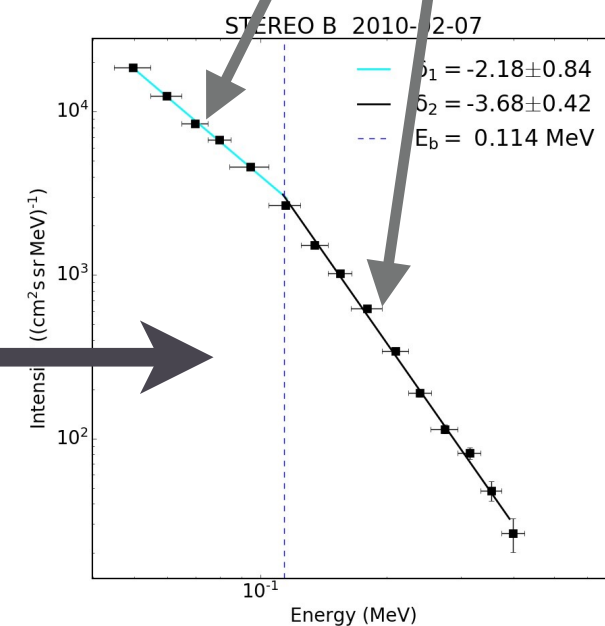

Hard X-Rays

STEREO spacecraft

We analyze 17 common events for spectral correlations

Which part of the in-situ spectrum should be used for correlation?

This study is accepted for publication in *A&A*:
