

# The TESS Input Catalog and Candidate Target List

**Keivan Stassun – Vanderbilt University**

For the TESS Target Selection Working Group (TSWG), especially  
Josh Pepper, Martin Paegert, Ryan Oelkers, Nathan De Lee, Willie  
Torres, and Science Office Head David Latham

# TICv8: Released May 2019

- All persistent, luminous objects that TESS can see
  - Does not include solar system or transient objects
- Compilation of photometric, spectroscopic, and astrometric catalogs
  - 1.7 billion stars and a few million galaxies
  - Based on **Gaia**, with star coordinates, proper motions, colors
- Calculated stellar parameters ( $T_{\text{eff}}$ ,  $M_*$ ,  $R_*$ )

Stassun et al. (2019), AJ, 158, 138; arxiv:1905.10694

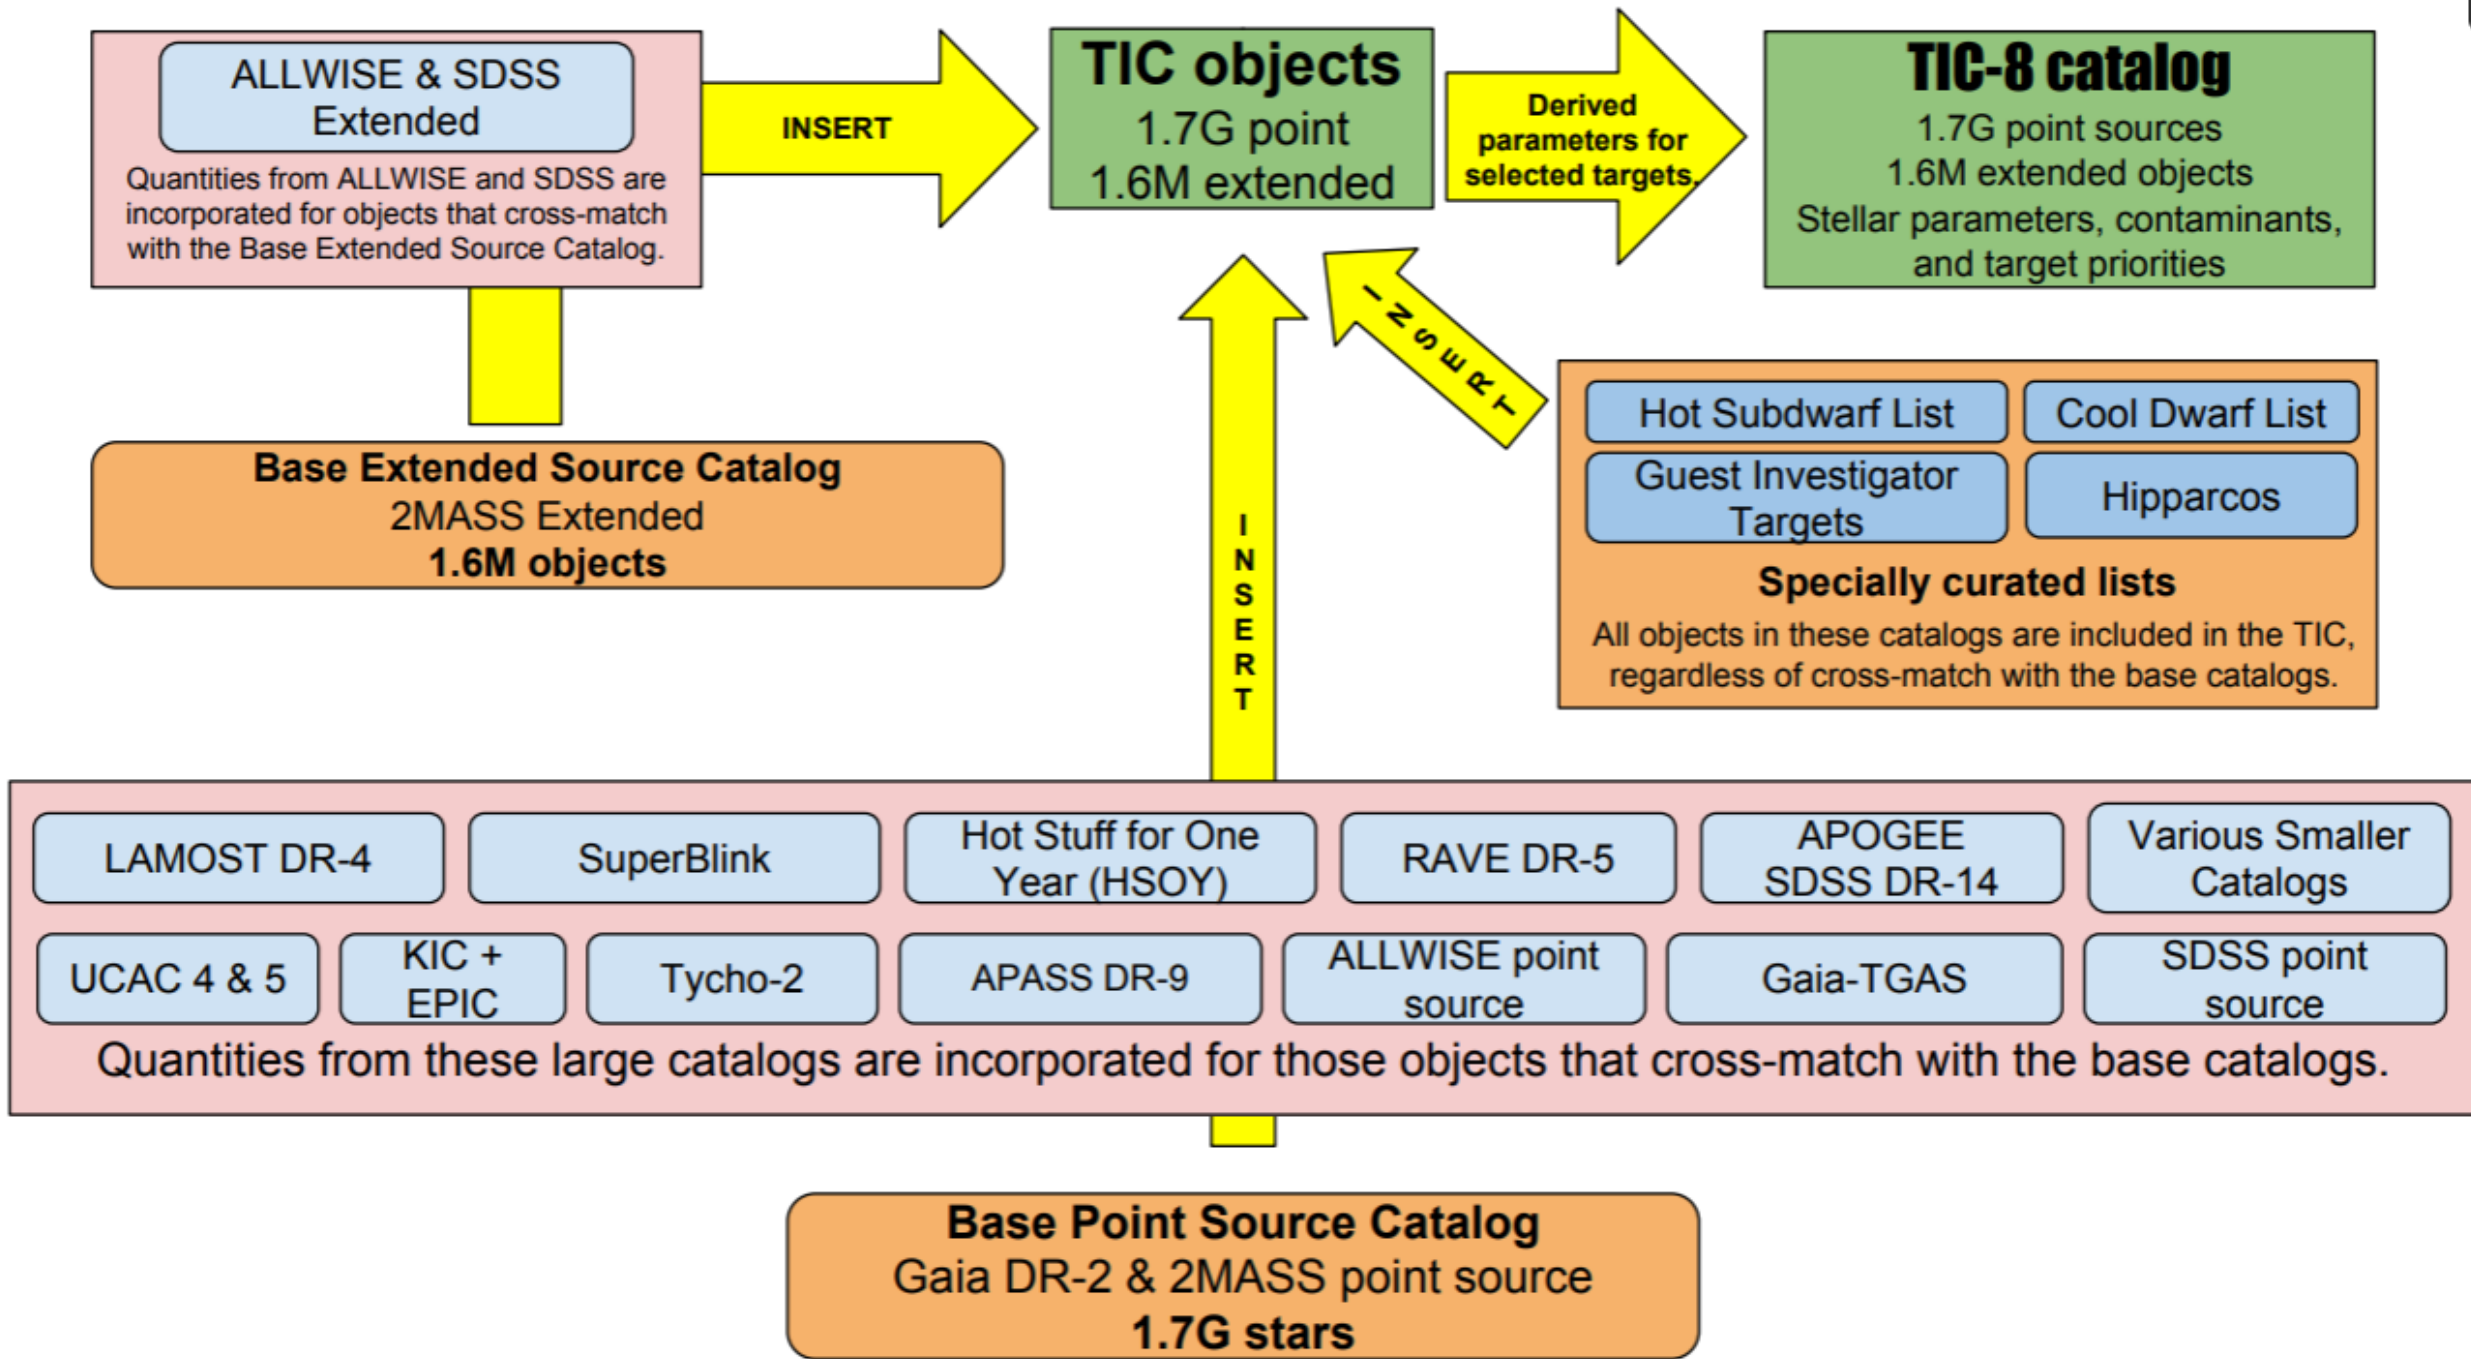

# The Candidate Target List (CTL)

- Subset of the TIC, prioritizing bright, cool, dwarf stars, optimized for transit detection with 2-minute cadence
- Observing priority is calculated for all CTL stars:

$$\frac{\sqrt{N_{sectors}}}{\sigma(Tmag)R^{3/2}}$$

Public interactive data portal at Filtergraph

# TIC and CTL contents summary

Property	TIC-7	TIC-8	Sub-population	TIC-7	TIC-8	CTL-8
T-mag	471 M	1.7 B	$T < 10$	966 M	913 M	257 K
$T_{\text{eff}}$	331 M	683 M	$T_{\text{eff}} < 4500 \text{ K}$	992 K	141 M	4 M
$R_*$	27 M	541 M	$R < 0.5R_{\odot}$	788 K	29 M	1.6 M
Proper Motion	317 M	1.3 B	$\mu > 1000 \text{ mas / yr}$	655	1092	498
Parallax	2 M	1.3 B	Distance < 100 pc	42 K	575 K	217 K

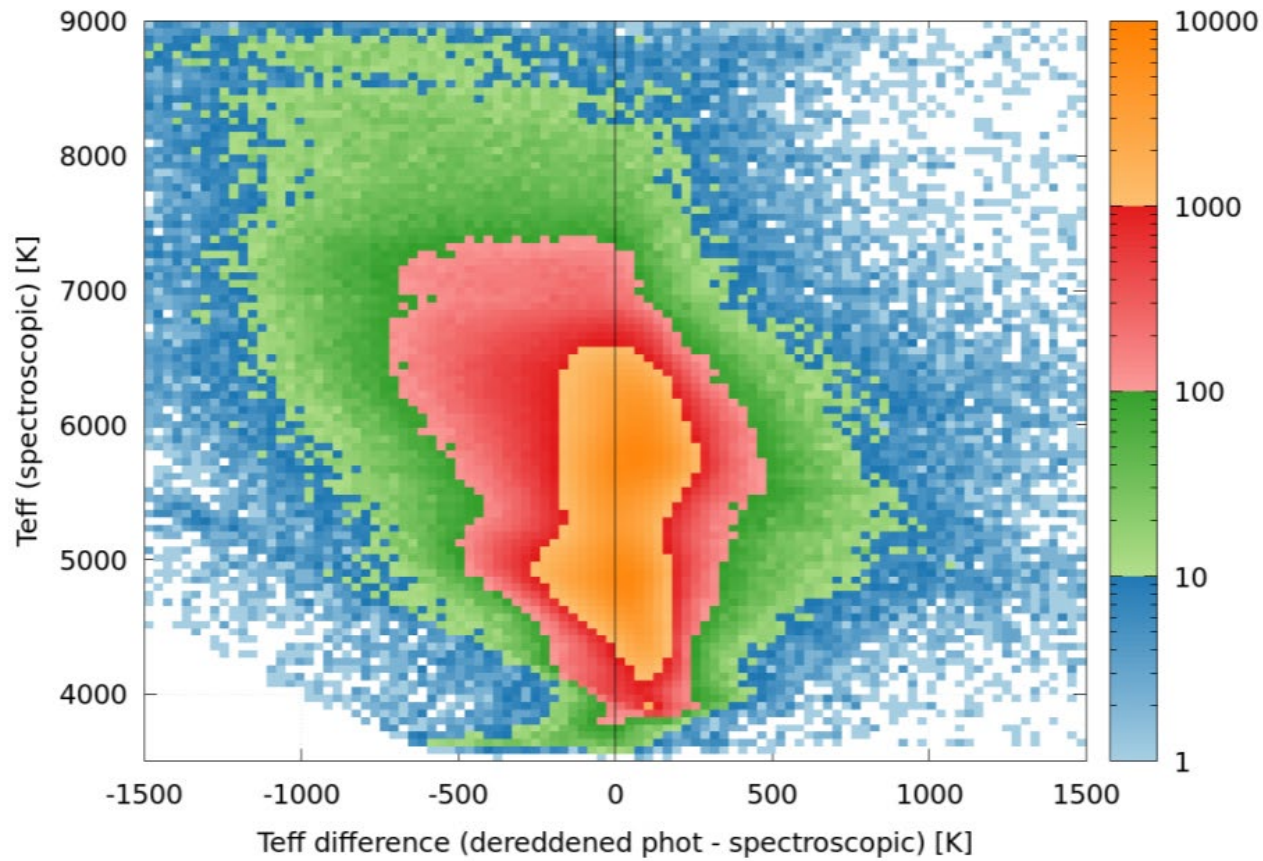

CTL-8

# Dereddening for calculating stellar $T_{\text{eff}}$ from colors

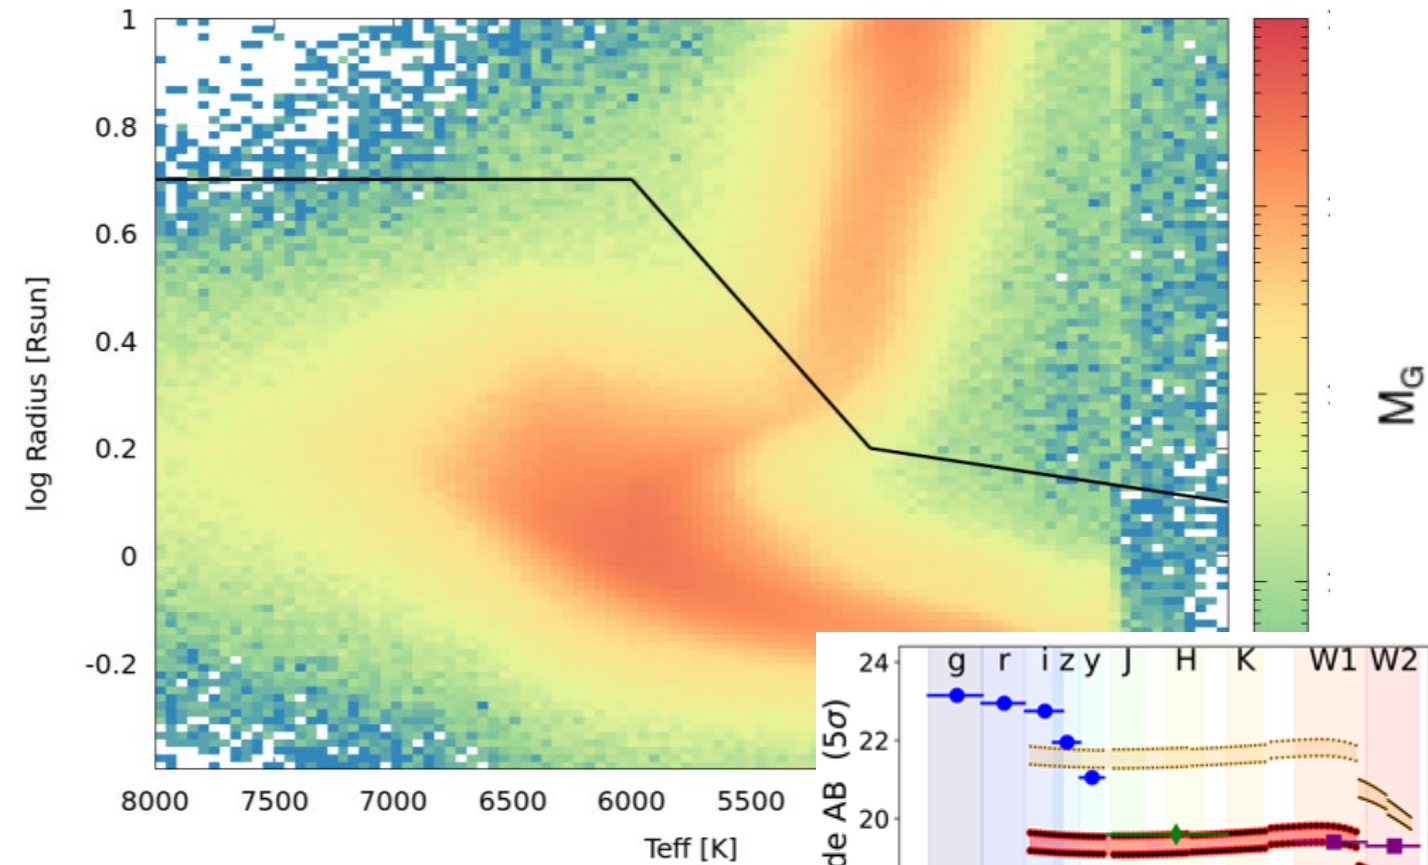

# Dereddening for calculating stellar Teff from colors

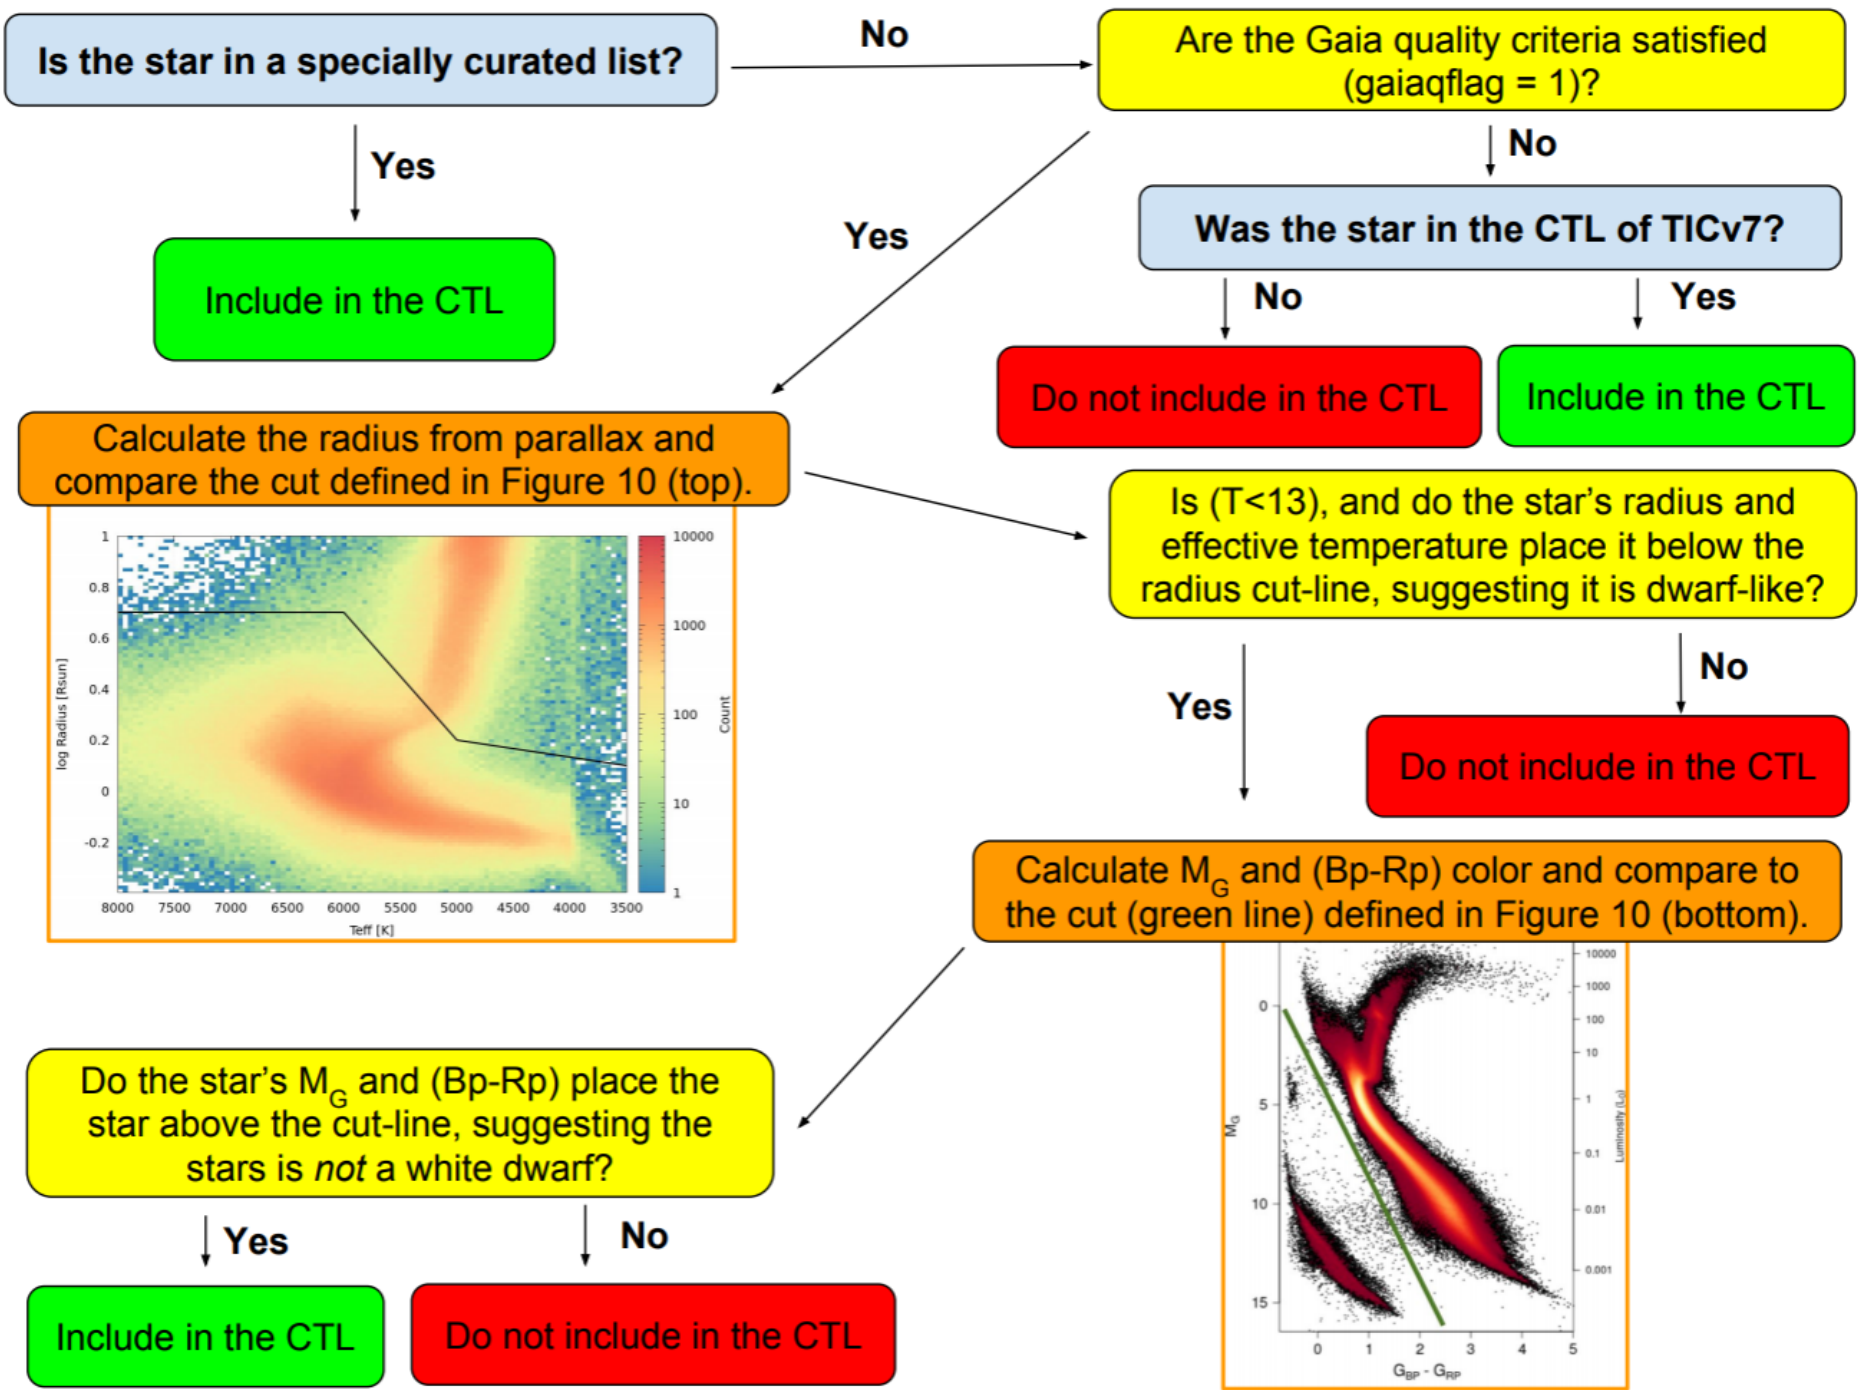

# Selecting dwarfs and subgiants for priority

**SPHEREx  
launching in  
2023**

Is the star in a specially curated list?

Include in the CTL

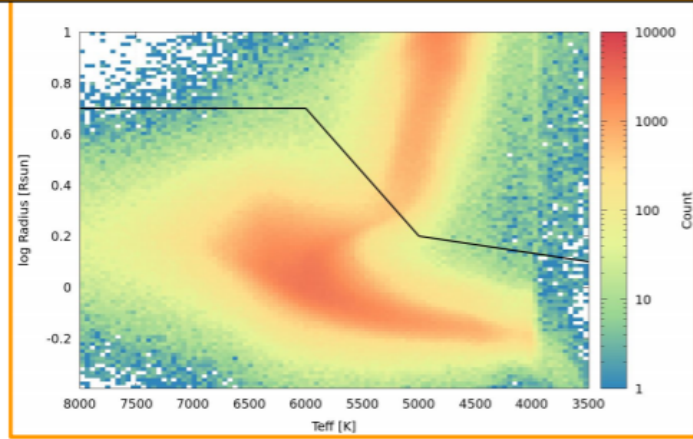

Are the Gaia quality criteria satisfied (gaiaqflag = 1)?

Was the star in the CTL of TICv7?

Do not include in the CTL

Include in the CTL

Calculate the radius from parallax and compare the cut defined in Figure 10 (top).

Is (T < 13), and do the star's radius and effective temperature place it below the radius cut-line, suggesting it is dwarf-like?

Do not include in the CTL

Calculate  $M_G$  and (Bp-Rp) color and compare to the cut (green line) defined in Figure 10 (bottom).

Do the star's  $M_G$  and (Bp-Rp) place the star above the cut-line, suggesting the stars is not a white dwarf?

Include in the CTL

Do not include in the CTL

CTL-8: top 400K

# Major Lessons Learned for PIC: General

- Decide early about catalog delivery and versioning protocols
  - Consider ways to have all data elements tied to a particular catalog version, so that you can know by looking at the data what catalog version it is from.
  - Being able to accommodate incremental catalog updates is very important (otherwise have to regenerate massive catalog for important fixes even if only a tiny subset of catalog is affected)
- Backwards compatibility for object IDs is essential
  - That means you have to manage new information with 'artifact', 'split', and other flags

# Major Lessons Learned for PIC: General

- Base the catalog on ONE source if possible (e.g., Gaia)
  - Adding in other \*source\* catalogs can lead to unintended consequences (e.g., SDSS “ghosts” around bright stars)
  - OK to add in lists of special targets (e.g., high proper-motion stars, white dwarfs, M dwarfs, etc), but define these very carefully
  - Supplement stellar \*properties\* from other catalogs as needed, but be careful about self-consistent properties (e.g., luminosity, gravity, density)
- Dealing with extinction/reddening corrections is important but challenging, particularly in the Galactic plane
  - Incorporate \*spectroscopic\* parameters to the extent possible, from reliable sources, but these will always be a small minority

# Major Lessons Learned for PIC: Quality Control

- Expect to spend a lot of time looking at edge cases (e.g., strange colors, missing parallax, etc), especially if the catalog is expected to be complete
  - Be especially careful to identify where Gaia is incomplete, such as very bright stars, very nearby stars, and very high-pm stars
- Define a set of tests on data completeness, integrity, and reliability, and run them automatically with each new catalog version (e.g., check for obvious top priority targets, crazy values, bizarre features in Teff distribution, etc).
- Decide how the catalog will disambiguate multiple cross-matches
  - Example: which of two very close Gaia sources should be matched with a spectroscopic catalog source?
  - Note also: Gaia parameters (including magnitude, parallax, stellar radius, etc) can be compromised by binarity

# Major Lessons Learned for PIC: Human/Hardware

- This will require much more effort than you think
  - “Just use Gaia” is naïve (we made that mistake!)
  - Ultimately we required ~5x more human effort than budgeted
- Do not spare expense on dedicated FAST hardware (e.g., SSDs!)
- A good, fast, shareable visualization tool is essential for development: We use [filtergraph.com](http://filtergraph.com)
- TIC effort has left a massive infrastructure upon which PIC can build
  - <https://www.cfa.harvard.edu/flemingdb/>
  - “Appendix A: Schemas, Tables and Connections” gives idea what the Master database looks like... it is MUCH more than we published
  - We have material (and personnel!) available to assist
