

Riding space-borne data with the TLS prototype

Wednesday 19 June 2019 14:00 (15 minutes)

The authors present an update on the status of the implementation of the TLS project, part of the MITIC “premiere” initiative, at the Gaia DPCT. We will address the experiments, both scientific and technological, selected as best representing the motivations behind the TLS idea. These include some of the fundamental elements for proving the paradigm of long-term preservation of data and calibrating pipelines.
